

Integrated Ecosystem Restoration &
Hurricane Protection in Coastal Louisiana:
Fiscal Year 2016 Annual Plan

DRAFT

committed to **our coast**

With the passage of Act 8 of the First Extraordinary Session of 2005 (Act 8), the Louisiana Legislature mandated the integration of hurricane protection activities (e.g., levee construction) and coastal restoration activities (e.g., river diversions or marsh creation). Act 8 also created the Coastal Protection and Restoration Authority (CPRA) and tasked it with oversight of these activities. The Office of Coastal Protection and Restoration (OCPR) was designated as the implementation arm of the CPRA. To avoid confusion, the 2012 Louisiana Legislature changed the name of the state agency from OCPR to CPRA.

The CPRA is required by Act 523 of the 2009 Regular Legislative Session, to produce an Annual Plan that inventories projects, presents implementation schedules for these projects, and identifies funding schedules and budgets. This Fiscal Year (FY) 2016 Annual Plan provides an update on the state's efforts to protect and restore its coast and describes the short-term and long-term results that citizens can expect to see as the state progresses toward a sustainable coast.

Fiscal Year 2016 Annual Plan: Integrated Ecosystem Restoration
and Hurricane Protection in Coastal Louisiana
Submitted to the
Senate Natural Resources Committee
House Natural Resources and Environment Committee
Senate Transportation, Highways and Public Works Committee
House Transportation, Highways and Public Works Committee by
The Coastal Protection and Restoration Authority of Louisiana
In accordance with R.S. 49:214.5.3 and R.S. 49:214.6.1

Coastal Protection and Restoration Authority Board Members

Jerome Zeringue, Chair
Governor's Executive Assistant for Coastal Activities

Stephen Chustz
Secretary, Louisiana Department of Natural Resources

Sheri Lebas
Secretary, Louisiana Department of Transportation and Development
Richard Savoie, Designee

Robert Barham
Secretary, Louisiana Department of Wildlife and Fisheries
Randy Pausina, Designee

Peggy Hatch
Secretary, Louisiana Department of Environmental Quality

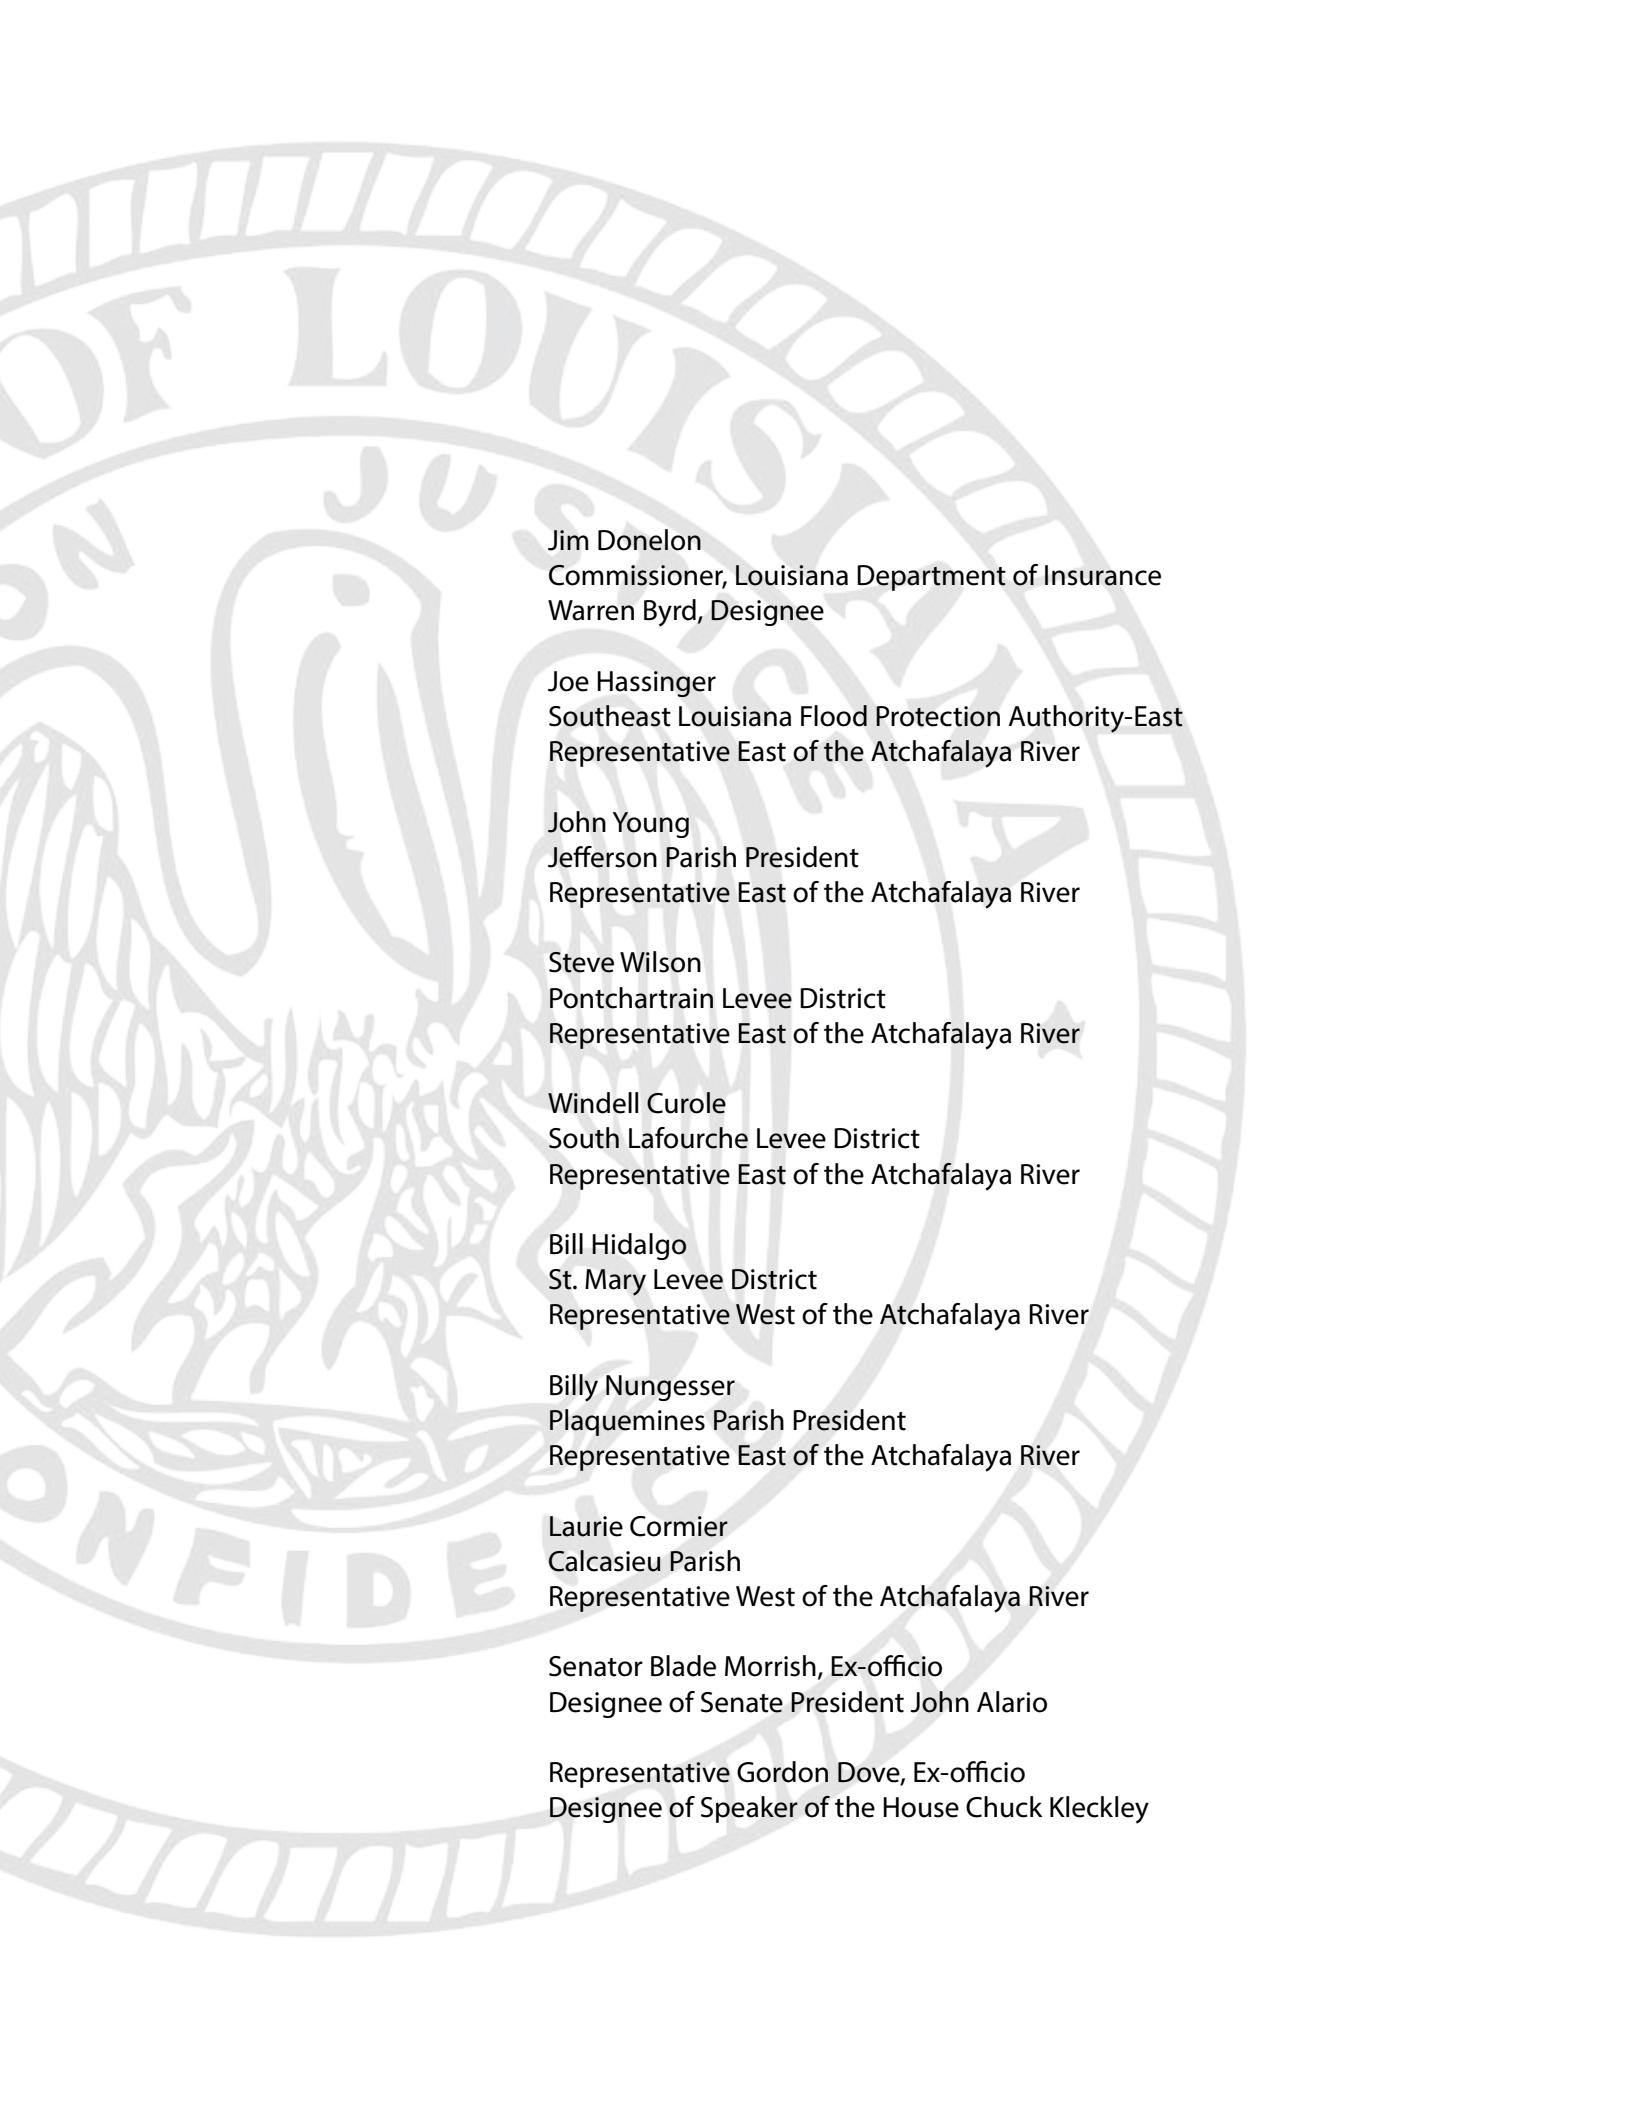

Steven Moret
Secretary, Louisiana Department of Economic Development
Paul Sawyer, Designee

Mike Strain
Commissioner, Louisiana Department of Agriculture and Forestry
Brad Spicer, Designee

Kristy Nichols
Commissioner, Louisiana Division of Administration
Craig Taffaro, Designee

R. King Milling
Chair, Governor's Advisory Commission on Coastal Protection, Restoration and Conservation

Kevin Davis
Director, Governor's Office of Homeland Security and Emergency Preparedness

A large, faint watermark of the Louisiana state seal is visible in the background. The seal features a central figure, possibly a Native American, holding a bow and arrow, surrounded by a circular border with the words "THE GREAT SEAL OF THE STATE OF LOUISIANA" and "1812".

Jim Donelon
Commissioner, Louisiana Department of Insurance
Warren Byrd, Designee

Joe Hassinger
Southeast Louisiana Flood Protection Authority-East
Representative East of the Atchafalaya River

John Young
Jefferson Parish President
Representative East of the Atchafalaya River

Steve Wilson
Pontchartrain Levee District
Representative East of the Atchafalaya River

Windell Curole
South Lafourche Levee District
Representative East of the Atchafalaya River

Bill Hidalgo
St. Mary Levee District
Representative West of the Atchafalaya River

Billy Nungesser
Plaquemines Parish President
Representative East of the Atchafalaya River

Laurie Cormier
Calcasieu Parish
Representative West of the Atchafalaya River

Senator Blade Morrish, Ex-officio
Designee of Senate President John Alario

Representative Gordon Dove, Ex-officio
Designee of Speaker of the House Chuck Kleckley

This public document was published at a total cost of \$7,020.

Five hundred copies of this public document were published in the first printing at a cost of \$7,020.

The total cost of all printings of this document was \$7,020.

The document was published by the Coastal Protection and Restoration Authority of Louisiana. This material was printed in accordance with standards of printing for State agencies established in R.S. 43:31. Printing of this material was purchased in accordance with the provisions of Title 43 of the Louisiana Revised Statutes. This plan was created by an interdisciplinary team from the CPRA led by Kyle Graham, Robert Routon, Joe Wyble, Jenny Kurz, Chuck Perrodin, Andrea Galinski, Chris Boudreaux, and Rocky Wager (USGS).

Coastal Protection and Restoration Authority, 2015. Fiscal Year 2016 Annual Plan: Integrated Ecosystem Restoration and Hurricane Protection in Coastal Louisiana. Coastal Protection and Restoration Authority of Louisiana. Baton Rouge, LA.

State of Louisiana

BOBBY JINDAL
GOVERNOR

February 2, 2015

Dear Friends,

When it comes to the CPRA's implementation of our Master Plan to protect, preserve and restore Louisiana's coast, Albert Einstein may have said it best: "We cannot solve our problems with the same thinking we used to create them."

Our annual plan reflects advancements in modeling and ground-breaking achievements in order to confront the risk to our coastal communities and land loss that has plagued our coast. We are proud of the efforts of those who are working hard to preserve and protect our valuable resources and those who provide them to our nation. We stand on those achievements and look ahead to an exciting year of accelerating progress and results.

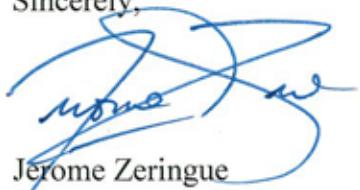

We are therefore pleased to present our *Fiscal Year 2016 Annual Plan, Integrated Ecosystem Restoration and Hurricane Protection in Coastal Louisiana*, the yearly report on our progress in implementing the State Master Plan and a look forward to what is planned for coming fiscal years.

With confidence bolstered by the experience and success of our past efforts, we are embarking on projects that are larger in scale and scope, creating more acres of land and marsh than ever before, and doing more to preserve and protect our people, property, environment, culture and history, and to restore what we have lost in the forms of natural barriers and marshes.

The firm foundation upon which CPRA operates owes much to its immediate past chairman, Garret Graves. We thank him for his years of energetic service and vow to continue the high level of integrity and adherence to scientific principles that he always insisted be at the heart of our endeavors.

We thank all of our partners, who are helping to develop our innovative approach to solving our problems to ensure the sustainability of our coast for generations.

Sincerely,

Jerome Zeringue

Chair, Coastal Protection and Restoration Authority

Purpose of the Annual Plan

This plan is the annual report card used to track the progress of projects outlined in *Louisiana's Comprehensive Master Plan for a Sustainable Coast*. Additional information and projections are included to foster a better understanding of what is being done and why and how it is being done.

Origin of the Annual Plan

In 2007, in response to Act 8's directive, the State released *Integrated Ecosystem Restoration and Hurricane Protection: Louisiana's Comprehensive Master Plan for a Sustainable Coast* (2007 Coastal Master Plan). The 2007 Coastal Master Plan established four planning objectives as benchmarks for implementing coastal protection and restoration projects and identified large-scale measures needed to achieve a sustainable coast. The 2007 Coastal Master Plan was passed unanimously in the Louisiana Legislature and its primacy was subsequently reaffirmed by Gov. Bobby Jindal in Executive Order BJ2008-7, which directed all state agencies to administer their activities, to the maximum extent possible, in accordance with the 2007 Coastal Master Plan's recommendations.

To accommodate the dynamic nature of coastal processes, Act 8 specifies that the Coastal Master Plan is a living document that will be updated approximately every five years. These updates incorporate new data and planning tools as they become available. To comply with the mandate set forth in Act 8, the first update of the Coastal Master Plan was submitted to the Louisiana Legislature in March 2012. It was unanimously adopted. The next update will be due in 2017.

Act 523 of the 2009 Regular Legislative Session directed the CPRA to produce an Annual Plan each year that inventories integrated coastal protection projects, presents implementation schedules for these projects, and identifies funding schedules and budgets.*

Evolution of the Annual Plan

Historically, the state's Annual Plans for coastal projects provided: 1) an inventory of projects for which the state planned to expend money and resources for a given fiscal year, and 2) recommendations for allocating Coastal Protection and Restoration Funds to those projects. The FY 2010 Annual Plan was the first plan to address the new integrated planning and prioritization directives specified in Act 8. The FY 2016 Annual Plan fulfills the legislative mandate of Act 8 by presenting the CPRA's three-year program for funding and implementing projects during FY 2016–FY 2018.

Additionally, the FY 2016 Annual Plan builds on the process first begun in the FY 2010 plan and provides an expanded discussion of the CPRA's progress in protecting and restoring the coast. Section 2 provides a summary of some of the progress and accomplishments achieved through FY2015; Section 3 outlines an implementation plan for FY 2016; Section 4 gives fiscal projections for FY 2016 to 2018; and the Appendices provide detailed information on CPRA projects, programs and initiatives.

*La R.S. 49:214.29(4) defines "integrated coastal protection" as "plans, projects, policies, and programs intended to provide hurricane protection or coastal conservation or restoration, and shall include but not be limited to coastal restoration; coastal protection; infrastructure; storm damage reduction; flood control; water resources development; erosion control measures; marsh management; diversions; saltwater intrusion prevention; wetlands and central wetlands conservation, enhancement, and restoration; barrier island and shoreline stabilization and preservation; coastal passes stabilization and restoration; mitigation; storm surge reduction; or beneficial use projects."

CPRA 2007-2014 HIGHLIGHTS

BY THE NUMBERS

\$18 BILLION
secured for protection and
restoration projects

Investment in projects constructed since
establishment of Coastal Master Plan

Protection Projects

\$8.73 Billion (Hurricane and Storm Damage Risk Reduction System)

\$2.39 Billion (Other Protection Projects)

\$55 Million (Infrastructure Projects)

Restoration Projects

\$1.024 Billion (Barrier Island / Headland Restoration)

\$475 Million (Marsh Creation)

\$362 Million (Shoreline Protection)

\$92 Million (Hydrologic Restoration)

\$40 Million (Diversions)

\$2 Million (Oyster Barrier Reefs)

\$29 Million (Other Restoration Projects)

constructed under construction headed to construction to bid in FY2015

MILESTONES

2007
Louisiana's first comprehensive
Coastal Master Plan approved

2011
The Water Institute of
the Gulf is established

2012
The Scofield Island project is the first to use
riverine sediment for barrier island restoration

2014
Largest construction contract
in the program's history awarded
for Caminada Headland

At Bayou Dupont, riverine sediment is
used for marsh creation for the first time

2009

Coastal Master Plan updated
2012 and unanimously approved

The Caminada Headlands project is the first to
use an offshore shoal for headland restoration

2013

The Water Campus is announced
2013

9
active dredges in 2014

26,241
acres of land benefited

256
miles of levee improved

45
miles of barrier islands
and berms constructed

20
number of parishes with
constructed projects

Section 1

Executive Summary

The FY 2016 Annual Plan contains budget projections (Tables ES-1 and ES-2) that show projected revenues and the amount of funds that would actually be needed to accomplish the proposed implementation plan over the next three fiscal years. Resources in FY 2016 will be focused on constructing coastal projects that have already been planned and/or designed (Figure ES-1). Funding projections include state budget surplus funds allocated for coastal projects. The implementation plan and funding projections presented in the FY 2016 Annual Plan represent a snapshot in time based on the available funding sources. The state is actively exploring new sources of funding to ensure that the coastal program maintains its current momentum, including Clean Water Act (CWA) penalties resulting from the *Deepwater Horizon* oil spill, future Gulf of Mexico Energy Security Act (GOMESA) funding, and credit initiatives that would generate revenue from the carbon sequestration and water quality benefits of constructed projects. The state is also exploring, as part of the Natural Resources Damage Assessment (NRDA) for the *Deepwater Horizon* oil spill, the implementation of coastal restoration projects to address injuries to natural resources caused by the spill.

New project opportunities may arise if additional funds become available after the approval of the FY 2016 Annual Plan, and conditions may necessitate reprogramming of existing funds to address changes on the ground. If necessary, reprogramming of existing and new funds would occur, with approval from the CPRA, to ensure that limited coastal program funds are allocated to the areas of greatest need and in a manner that will provide the greatest overall benefit to the coast. Such flexibility allows the coastal program to respond effectively to unforeseen events that take place outside the legislatively mandated planning cycle.

Stay Informed

We encourage you to join us as we move forward in our efforts to protect and restore coastal Louisiana. The CPRA Board conducts monthly meetings to provide a forum for updates and public discussion of our current work. In addition, many new tools are being developed to allow greater visibility of our progress and to provide increased access to information. These resources and information about upcoming meetings can be found online at www.coastal.la.gov.

► Table ES-1: Projected Three-Year Revenues (FY 2016 - FY 2018)

Revenue Sources	FY 2016	FY 2017	FY 2018	Program Total (FY 2016 - FY 2018)

Notes

1. Annually recurring revenue source.
2. Represents anticipated Federal reimbursement for CWPPRA projects led by CPRA in which the State is initially incurring more than its 15% cost share during project implementation.
3. NRDA funds have not been procured; projections represent possible FY 2015 - FY 2017 expenditures if funding is procured by June 30, 2014. NRDA project schedules are currently under development and may be refined at a later date; funds will be distributed according to final project schedules.
4. Supplemental funding to augment construction of eligible projects (specific projects to be determined at a later date).
5. Used to partially fund TV-0057.
6. Used to partially fund TV-0052-2.
7. Represents anticipated balance as of FY 2016 of an initial deposit of \$6.75 million of funds from the MOEX settlement.
8. Used to fund Coastal Community Resiliency Program.
9. Used to fund monitoring of constructed Berm to Barrier projects.
10. Represents anticipated Federal reimbursement for CWPPRA and WRDA OM&M activities led by CPRA in which the State is initially incurring more than its cost share during project implementation.
11. Represents anticipated reimbursement associated with recovery from past disasters which has been obligated by FEMA.
12. CPRA is pursuing FEMA recovery funding through the FEMA appeals process to restore the form and function of the Coastal Barrier Island Resource System (CBRS) units S01-S08 which were lost as a result of Hurricane Katrina. The cumulative cost of this restoration is estimated to be on the order of \$500 million.
13. Represents anticipated reimbursement of FEMA recovery funds through the FEMA appeals process to restore various beach and dune restoration projects damaged by Hurricane Isaac.
14. Represents reimbursement of expenditures for CPRA oil spill response activities.

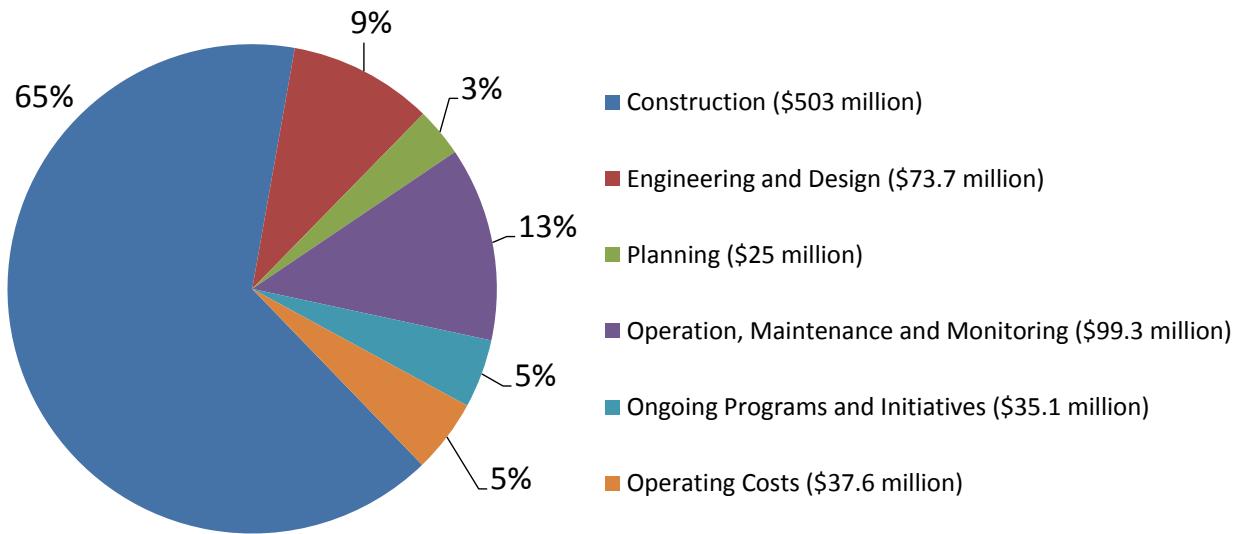

► Table ES-2: Projected Three-Year Expenditures¹ (FY 2016 - FY 2018)

Revenue Sources	FY 2016	FY 2017	FY 2018	Program Total (FY 2016 - FY 2018)
CWPPRA State Expenditures (<i>not including surplus expenditures</i>) ²	\$15,514,503	\$16,561,465	\$17,091,141	\$49,167,109
CWPPRA Federal Expenditures ³	\$41,667,195	\$43,438,535	\$42,908,859	\$128,014,589
WRDA Project Expenditures (<i>not including surplus or CIAP expenditures</i>)	\$0	\$0	\$0	\$0
CIAP Projects and Program Expenditures (<i>not including surplus expenditures</i>)	\$69,114,819	\$14,791,346	\$0	\$83,906,165
Surplus Projects and Program Expenditures	\$216,174,656	\$68,260,848	\$24,593,938	\$309,029,442
Community Development Block Grants	\$10,870,161	\$3,553,851	\$0	\$14,424,012
HSDRRS 30-Year Payback ⁴	\$0	\$93,149,239	\$93,149,239	\$186,298,478
MOEX Project Expenditures	\$3,226,712	\$435,847	\$1,409,400	\$5,071,959
DOTD Interagency Transfer - HNC Deepening Expenditures	\$100,000	\$45,470	\$0	\$145,470
Capital Outlay Project Expenditures	\$9,599,885	\$0	\$0	\$9,599,885
State-Only Project Expenditures (<i>non-surplus</i>)	\$136,000	\$4,427,400	\$136,000	\$4,699,400
NRDA Early Restoration ⁵	\$141,479,000	\$69,062,699	\$231,161	\$210,772,860
NFWF Expenditures (<i>not including surplus expenditures</i>)	\$108,508,359	\$42,669,185	\$9,275,194	\$160,452,738
Proposed RESTORE Expenditures (<i>not including surplus expenditures</i>)	\$22,654,397	\$24,483,191	\$78,474,156	\$125,611,744
LDNR Mitigation Expenditures ⁶	\$800,000	\$0	\$0	\$800,000
LDNR Beneficial Use Expenditures ⁶	\$500,000	\$0	\$0	\$500,000
Iberia Parish IGA Expenditures ⁷	\$380,000	\$0	\$0	\$380,000
St. Mary Levee District Expenditures ⁸	\$875,000	\$0	\$0	\$875,000
OM&M - State Expenditures (<i>not including surplus or CIAP expenditures</i>)	\$6,281,547	\$7,701,707	\$6,763,682	\$20,746,936
OM&M - Federal Expenditures ⁹	\$36,354,917	\$29,755,479	\$17,211,610	\$83,322,005
OM&M - Marine Debris Removal (<i>partially reimbursed by FEMA</i>) ¹⁰	\$1,640,130	\$0	\$0	\$1,640,130
OM&M - Isaac Beach and Dune Recovery (<i>partially reimbursed by FEMA</i>) ¹¹	\$45,823,644	\$45,823,644	\$0	\$91,647,288
Project Support	\$4,100,000	\$4,000,000	\$4,000,000	\$12,100,000
Operating Costs	\$37,625,874	\$45,994,647	\$49,761,799	\$133,382,320
Total Projected Expenditures	\$773,426,799	\$514,154,553	\$345,006,178	\$1,632,587,531

Notes

1. Represents proposed expenditures provided that commensurate level of funding is received.
2. Because CWPPRA projects compete for funding annually, CWPPRA expenditures as presented in Appendix B (which include projected expenditures for approved projects only) do not adequately capture likely CWPPRA expenditures in outlying years. The State's estimated CWPPRA expenditures for FY 2017 - FY 2018 are therefore based on prior years' expenditures.
3. Represents anticipated Federal reimbursement for CWPPRA projects led by CPRA in which the State is initially incurring more than its 15% cost share during project implementation.
4. Payback is based on current HSDRRS construction schedule; payback will not commence until completion of HSDRRS construction activities and consequently payback schedule may be revised at a later date.
5. NRDA funds have not been procured; projections represent possible FY 2015 - FY 2017 expenditures if funding is procured by June 30, 2014. NRDA project schedules are currently under development and may be refined at a later date; funds will be distributed according to final project schedules.
6. Supplemental funding to augment construction of eligible projects (specific projects to be determined at a later date).
7. Used to partially fund TV-0057.
8. Used to partially fund TV-0052-2.
9. Represents anticipated Federal reimbursement for CWPPRA and WRDA OM&M activities led by CPRA in which the State is initially incurring more than its cost share during project implementation.
10. Represents anticipated reimbursement associated with recovery from past disasters which has been obligated by FEMA.
11. Represents anticipated reimbursement of FEMA recovery funds through the FEMA appeals process to restore various beach and dune restoration projects damaged by Hurricane Isaac.

► **Figure ES-1: Projected FY 2016 Expenditures by Project Phase**

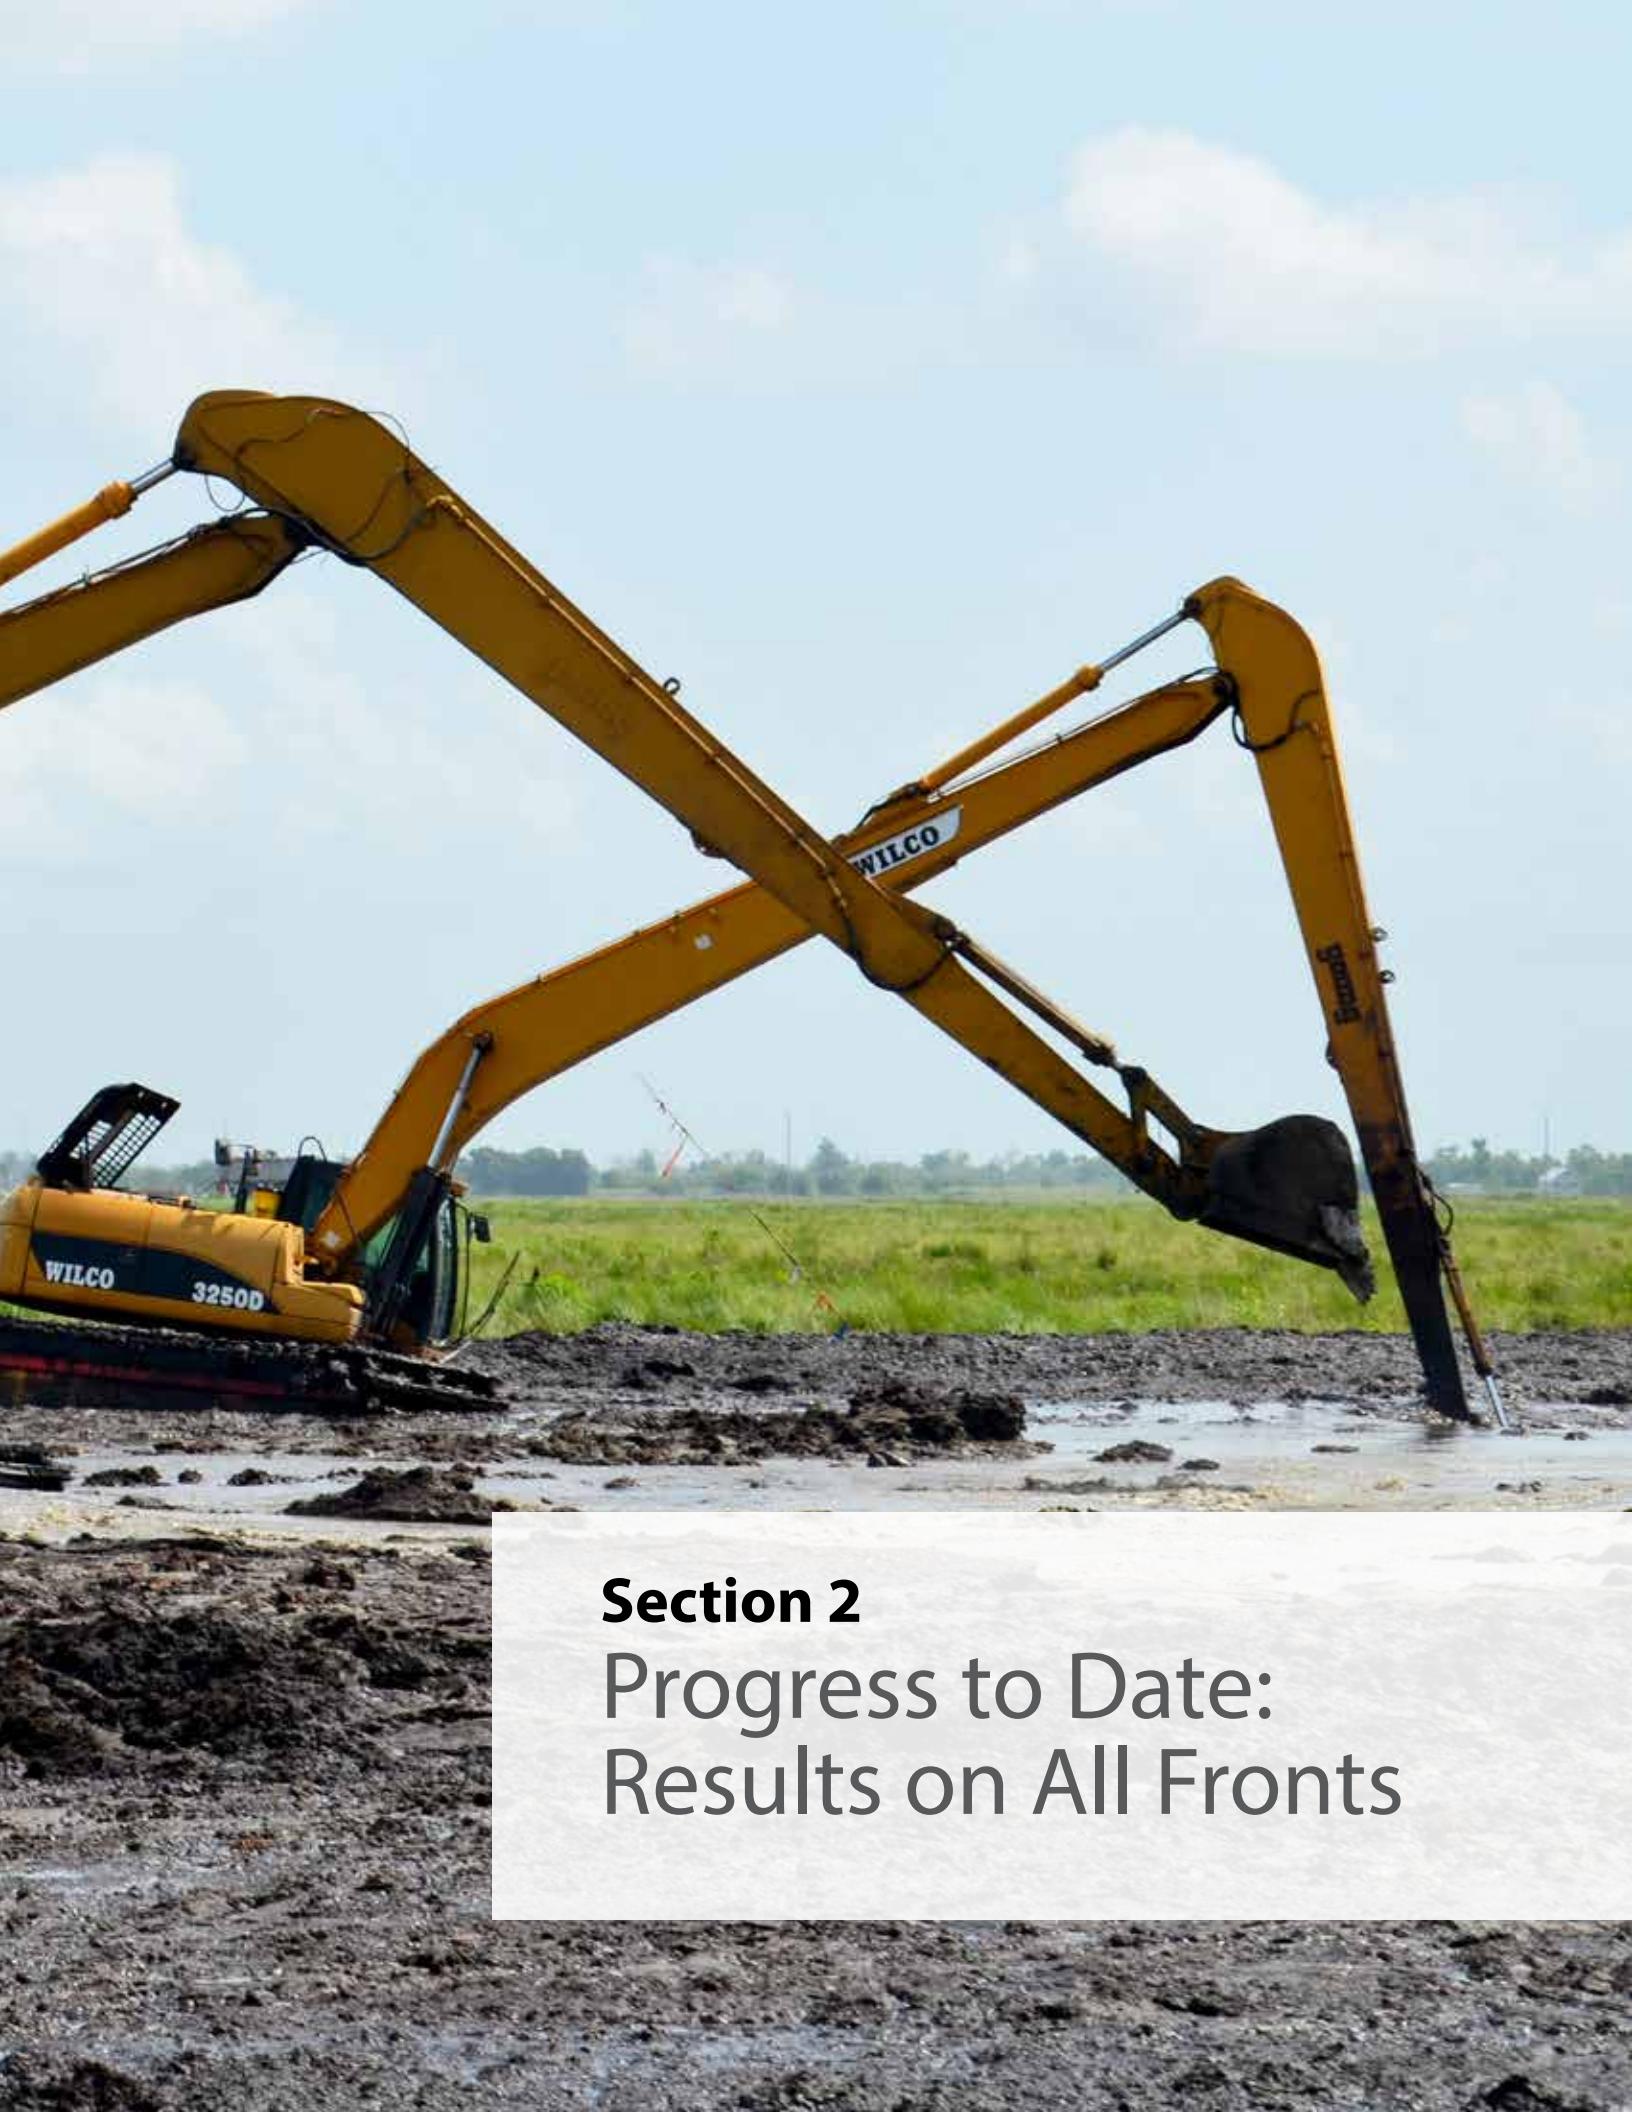

Notes

- Construction includes Beneficial Use (\$4 million)
- OM&M includes BIMP (\$361,000), Repair/Rehabilitation of Projects (\$1.1 million), Marine Debris Removal (\$1.6 million), and Isaac Beach and Dune Recovery (\$45.8 million).
- Ongoing Programs Includes Project Support (\$4.1 million)

**TOTAL Expenditures
\$773 million**

Section 2

Progress to Date: Results on All Fronts

Congratulations to the Upper Elementary Division winners of the CPRA and Youth Wetlands Program's inaugural Student Poetry Contest.

"The Amazing Louisiana Coast"

1st Place

My coast, so broad, so wide
The ocean blows side to side.

The coast, my life, my soul,
Ocean depths, black as coal.

"Stop the erosion, stop the decay"
I shout to the ocean waves.

Save the creatures, crabs and all,
Don't let them die like the ones they are.

Let us enjoy the coast,
Let us brag, let us boast.

This is the time to stop and savor,
Drop the tools for all labor.

Enjoy our beautiful coast,
for it might be gone in our futuristic most.

*By: Stephen Embrey, Age 11
Dubach, La.*

"Our Under Water World"

2nd Place

The waves crash through the Gulf,
The water,
As green as an emerald,
Is the home to the most beautiful of creatures —
The shrimp, which float through the current,
The fish that swim through the muddy waters.

The one thing that beats them all,
Is the art piece they make,
Combined.

The amazing world we never see,
Always flowing in harmony.
Beneath the waves is a palace of blue
To house the creatures of the Gulf.
For things so big and things so small,
A perfect under water world.

*By: Nikos Verlenden, Age 10
New Orleans, La.*

"The Adventurous Bayou"

3rd Place

Cypress roots above the land
Bugs fly here and there
Iris in my hand.

Mushy mud against my feet
Pelicans gliding
Finding fish to eat.

Moist humid air on my lungs
Lizards crawl up trees
Snakes hiss with their tongues.

A green blanket over Earth
Some blue ribbons flow
It gives mind new birth.

*By: Ella Guichet, Age 10
New Orleans, La.*

Section 2

Progress to Date: Results on All Fronts

"However beautiful the strategy, you should occasionally look at the results." - Winston Churchill

Progress on the Ground

In 2007, the Louisiana Legislature adopted the first Coastal Master Plan. The plan presented a conceptual vision of a sustainable coast and established the goals and objectives that continue to drive the restoration and protection efforts of our coastal program. Since then, more resources have been invested in coastal protection and restoration in Louisiana and more progress has been made than in any other period in our state's history. The key to success has been twofold – persistent improvement of our ability to get dollars on the ground quickly and efficiently to effect change and continued development of our foundation – the science, the tools, and the people that support this critical work.

Since 2007 we have implemented larger, more complex, and more impactful projects than ever before. Working with local, state, and federal partners, the CPRA has constructed over 45 miles of barrier islands and berms, benefitted more than 25,700 acres of coastal habitat, and built or improved approximately 250 miles of levee, affording protection to coastal communities and restoring important habitats for fish and wildlife. Although we have faced our share of challenges, together we have reached a number of milestones and achieved some exciting program "firsts" along the way.

Some of these most notable accomplishments include:

Increased Protection for Coastal Citizens

Protecting the people of Louisiana and our way of life is of prime importance to the CPRA, too important to leave to just one course of action. The CPRA uses a multi-pronged approach that is adaptable to varying conditions, geography, and circumstances. Over the last seven years, a greater level of protection has been provided to millions of coastal citizens and regionally and nationally important assets.

New Orleans

The Crescent City is better protected today than at any time during its history. Unlike during Hurricane Katrina, New Orleans now has a perimeter defense against storm surge, 133 miles of strengthened levees, massive T-Walls that replaced smaller, inferior I-Walls, new gates that can be closed to seal off roadways and navigation channels, and 75 pump stations to expel rainwater that falls within the system when it is closed against storm surge.

Engineers with the U.S. Army Corps of Engineers inspect one of the massive flood gates in the \$1.4 billion hurricane protection system on the West Bank of greater metropolitan New Orleans. When the system is completely closed the city could still flood from torrential rains, so 75 pump stations—including the world's largest pump station—have been installed for water removal.

Houma, Thibodaux, Lafourche, and Terrebonne

The Lafourche-Terrebonne region is one of the nation's busiest and most productive areas, but what makes it valuable also makes it vulnerable. Already a low lying area in the coastal zone, the region is increasingly at risk as the combination of subsidence, sea level rise and saltwater intrusion seemingly dissolves the marsh buffer that long afforded it a measure of protection against storm surge. But while the residents need help, they aren't waiting on anyone else to get the fight started.

The Morganza to the Gulf of Mexico Hurricane Protection Project is a perfect example. Instead of waiting for long-promised federal assistance, the local citizens have taxed themselves and partnered with the CPRA to begin construction of 98 miles of new or improved levees and T-walls, 12 floodgates and the Bubba Dove Floodgate, a 250-foot long barge gate and receiving structure on the Houma Navigation Canal. The state has contributed more than \$100 million to the project through State Surplus funding and Capital Outlay. The ultimate goal is to protect more than 52,000 residential and non-residential structures and positively impact up to 175,000 residents.

The U.S. House of Representatives and the Senate have voted approval of this project on three occasions, but despite the support, federal funding remains a challenge. Originally priced at \$887 million in 2007, post-Katrina the projected cost has gone up to \$10.3 billion according to the Corps of Engineers. The state and local governments are proceeding to the fullest expense possible, but federal money is needed if the system is to be completed and effective.

Larose to Golden Meadow

The 48-mile ring levee system known as the Larose to Golden Meadow Flood Protection project allows approximately 27,000 people to continue their long cultural story in close-knit communities like Larose, Cut Off, Belle Amie, Galliano and Golden Meadow. A lock at the southern end of the system allows the free flow of navigation during normal times, but can be closed to serve as a safe harbor for marine vessels seeking refuge during storms, something of critical importance to the facilities at Port Fourchon, one of the nation's most vital ports for offshore and imported oil and gas. The CPRA has provided \$27.8 million of State Surplus Funds to improve more than 23 miles of levees and floodwalls for the protection of these communities.

Jean Lafitte

Sitting at the apex of the Barataria Basin, the greater Jean Lafitte community is subject to all the ills wrought by coastal subsidence, saltwater intrusion, and ecological degradation.

A long-desired ring levee system is under construction financed primarily through CPRA State Surplus funds. While no storm surge in the past 30 years has been higher than six feet, the new levee system will stand at 7.5 feet and have the foundational capacity to be heightened to 16 feet, the more desirable standard for 100-year storm protection.

The need for a ring levee is substantiated by the fact that the Jean Lafitte area has been damaged by six disasters since 2005, most recently by flooding from Hurricane Isaac in 2012. The community is just south of New Orleans on the West Bank.

Photo by Susan Poag, NOLA.com | The Times-Picayune archive

South Central Louisiana

Like all of coastal Louisiana, the South Central Coast is vulnerable to storm surges that are increasingly less abated because of a deteriorating coastal environment. Many areas that are well inland have been designated as V-Zones, the FEMA flood map designation for areas subject not only to flooding, but to damaging wave action as well. In addition, agricultural areas are increasingly susceptible to crop-destroying saltwater intrusion.

In St. Mary Parish, the CPRA oversaw construction of a barge gate, a 170-foot steel flood wall, and 800 feet of earthen levee to address storm surge from the Franklin Canal and the flooding of 300 homes, 600 acres of land, and Highway 90, a major evacuation route. The next phase of this \$6.5 million project will add additional protection for the area and the Town of Franklin by adding a pump station, increasing protection to more than 2,400 people.

Vermilion Parish is home to the town of Erath, the nexus of the natural gas pipeline system in South Louisiana and home to the Henry Hub, the major pricing point for natural gas futures contracts traded in the nation's major financial markets. In 2005 the town was completely cut off and flooded by storm surge from Hurricane Rita. Just two miles to the east, spanning the Vermilion-Iberia Parish border, is the shrimping community of Delcambre. Rita's surge came 10 miles inland through the Delcambre-Avery Canal, flooding all but 25 of the town's 900 homes with six feet of water.

Until it is conceivable to build large levees in rural areas, individual flood control structures must be employed. For the Erath and Delcambre areas that means gates on both the Bayou Tigre and Delcambre-Avery waterways. CPRA is working with Vermilion Parish on a \$12-million combined floodgate and pump facility on Bayou Tigre, while early design concept studies are underway for the larger structure needed on the heavily navigated Delcambre-Avery Canal in Iberia Parish.

Southwest Louisiana

Sparked by surprising advances in oil and gas production, Cameron Parish and Calcasieu Parishes are on the verge of a population and infrastructure explosion—adding to the urgency for preserving the ecosystem that is both home and protection for the people who live and work there.

The shoreline of Cameron Parish is the first line of defense against storm surge for the rural marsh areas and the populous city of Lake Charles. Therefore, \$45 million in state funds have been invested to rebuild six miles of the rapidly deteriorating beachfront with sand mined from 20 miles offshore, creating 523 acres of shoreline. Efforts are underway to find means of reducing saltwater intrusion through the busy Calcasieu Ship Channel while allowing for the increased traffic that is soon to come.

Saltwater intrusion and declining sediment delivery have greatly affected the marsh environment that makes up the vast majority of the land area of Cameron Parish. However, by beneficially using material routinely dredged from the ship channel, marsh is being created. The Sabine Refuge Marsh Creation project is using approximately four million cubic yards of material to build about 875 acres of new marsh in the Sabine National Wildlife Refuge.

Sediment dredged from the Calcasieu Ship Channel is put to beneficial use by pipelining to fill in areas that had deteriorated into open water. In all, more than 1,400 acres of marsh have been restored, a start to adding back the natural buffer that can help ameliorate future damage to the area's communities and infrastructure.

Project Engineering Advancements

Lessons learned through years of project implementation and an increase in funds available for coastal restoration have enabled us to tackle larger and more complex projects. These factors have allowed us to tap sand sources outside of the active coastal system, infusing the sand-starved coastal system for long term benefits and improving individual project sustainability.

First Use of Riverine Sediment for Marsh Creation

Never before had the Mississippi River been tapped by man for its sandy sediment to build marsh land, but that changed in 2009 when the Bayou Dupont Sediment Delivery System became the first project to use riverine sand for marsh creation. Its success has led to the building of thousands of acres via the same process, including the current expanded phase two of landbuilding along Bayou Dupont and the subsequent westward extension of land and marsh creation via the Long Distance Sediment Pipeline to follow.

This pioneering project, less than 20 miles south of New Orleans, dredged approximately 2.6 million cubic yards of sandy material from the riverbed and delivered them five miles to the southeast via pipeline, creating more than 560 acres of intertidal marsh inside of three areas defined by nearly 26,000 linear feet of earthen containment dikes.

Another first for this project area is an agreement for a permanent right-of-way for a pipeline corridor to be used in newer phases of Bayou Dupont land creation and the Long Distance Sediment Pipeline project that will continue to build land and marsh westward into the Barataria Basin. This permitting arrangement and a unique partnership amongst CPRA, the landowner, and the governments of Plaquemines, Jefferson, and Lafourche Parishes will efficiently reduce red tape and save time and money as are projects progress now and into the future.

First Use of Riverine Sediment for Barrier Island Restoration

While Bayou Dupont was the first use of riverine material for large-scale marsh creation, Riverine Sand Mining/Scofield Island Restoration represents an even bigger engineering first: the use of Mississippi River sediment to restore a barrier island. It did what some said could not be done: dredging and then pipelining sediment a distance of 22 miles, the longest pipeline conveyance of its kind ever. This enabled the transport of 1.9 million cubic yards of river sand to create 150 acres of beach and dune on this once-withering barrier island. Another 1.5 million cubic yards of material created 360 acres of back marsh habitat.

The method was subsequently used to rebuild another barrier island, nearby Shell Island. Riverine sand restored approximately 1.3 miles of shoreline and a combined 307 acres of beach and marsh. The next phase will add another 2.8 miles of gulf shoreline and 692 acres of beach and marsh.

First Use of Offshore Shoal Sands for Barrier Headland Restoration

Offshore sand from Ship Shoal in federal waters is being used in the CPRA's largest construction project to date the Caminada Headland Beach and Dune Restoration projects located in Lafourche and Jefferson Parishes. This headland is important to the protection of the nation's vital energy hub at Port Fourchon and

serves as a central sand source to the down-drift flanking barrier islands, naturally nourishing Timbalier Island to the west as waves transport sand along the coast. These projects, with a combined price tag of \$218 million, are using a staggering 8 million cubic yards of sand to restore 13 miles of beach and 792 acres of beach and dune habitat.

This is the first-ever use of resources from Ship Shoal, the largest deposit of sand in accessible waters off the coast of Louisiana. The sand from the shoal was identified as a target for coastal restoration decades ago. However, we have only recently been able to tap the sediment source for barrier headland restoration. Sand placed on the headland had to be dredged and barged approximately 27 miles to the project site, five to six times further than ever before.

Cameron Parish Shoreline Restoration is another project that recently utilized sand from an offshore shoal. The project used nearly 2 million cubic yards of sand from Sabine Bank, located approximately 20 miles offshore, to benefit 523 acres and restore more than eight miles of beach and dune habitat.

The shoreline in this area suffered significant erosion as a result several hurricanes, compromising the integrity of Louisiana Highway 82 and risking exposure of thousands of acres of wetlands. This critical project will keep the shoreline position at or seaward of the current position for 20 years, lessening the chance of losing the beachfront and highway and protecting the delicate marshland ecosystem from increased salinity levels.

Restoring Barataria Basin

The ongoing restoration of the Caminada Headland adds to an impressive amount of work completed along the protective perimeter of the Barataria Basin since 2007. Other barrier island and headland restoration projects in the area include Pass Chaland, East Grand Terre, Pelican Island, Shell Island East, and Scofield Island. These projects represent a combined investment of over \$440

million. Restoration work included the placement of over 28 million cubic yards of sediment, benefitting more than 3,300 acres of dune and marsh and protecting nearly 25 miles of shoreline. Additional work on the Barataria Basin barrier island chain is anticipated to begin as early as spring of 2015 on Shell Island West and Chenier Ronquille as part of *Deepwater Horizon* early restoration.

As a complement to restoration along the perimeter, an additional 40 projects have either been completed or are currently in construction or engineering and design within the basin. These projects represent a total estimated commitment of more than \$7 billion. Once fully implemented, this suite of projects will benefit an additional 95,000 acres of coastal habitat and build or improve over 21 miles of levees.

Investments in Our Foundation

Equally as impressive as the amount of restoration and protection work underway, is the amount of brainpower fueling the coastal program. In Louisiana, there has been tremendous growth in academic, public, and private capacity to meet the increasing demands of the coastal sector, and since 2007, the state has invested approximately \$185 million in the scientific and technical expertise, tools, and technology that form the foundation of our work.

Monitoring Advancements

Over the last decade we have significantly expanded our monitoring capabilities and shifted our focus from project-specific monitoring towards evaluating and understanding coast-wide trends. Early project-specific monitoring efforts through the Coastal Wetlands Planning, Protection and Restoration Act (CWPPRA) program were replaced by the Coastwide Reference Monitoring System (CRMS) in order to capture consistent monitoring parameters across projects which allowed us to evaluate the effectiveness of not only individual projects, but of our overall program and to provide a means to assess overall landscape change.

We are now taking that a step further and working together to build an even more comprehensive, systematic monitoring program that, for the first time in the history of our state, contemplates a combination of restoration, protection, and socioeconomic parameters. The Systemwide Assessment and Monitoring Program (SWAMP) will ensure a comprehensive network of coastal data collection activities to support the development, implementation and management of the coastal protection and restoration program. SWAMP has identified a set measurable attributes, necessary to support the restoration and protection program and to document the overall ecological condition of the coastal system. Once fully functional, the program will support the CPRA by allowing for the evaluation of project and program performance, supplying the data needed for detecting system change, and supporting damage assessments, flood risk management, and modeling.

Concurrent with the development of the SWAMP framework, was the development of a monitoring inventory designed to catalog active, long-term monitoring efforts along the coast. Today, through a combined effort of state and federal agencies, we are collecting data from more than 1,700 monitoring sites across coastal Louisiana.

Modeling Advancements

SWAMP is designed to enable efficiency in data collection and use, create consistency across CPRA programs, leverage existing data collection activities, and provide transparency in the assessment of CPRA and other coastal activities. Together, we are building the most robust network of integrated protection and restoration data in the history our coastal program to further our understanding of coastwide processes and to better inform and support our decision making.

Coastal Louisiana has decades of experience utilizing models to assist in the planning, engineering, design, construction, and operations of restoration and protection projects. Since the early 2000s, modeling efforts have significantly evolved and improved as a result of increases in investments, data availability, computer processing power, and scientific understanding of the Louisiana coastal ecosystem. The modeling tools currently utilized to inform our decision making offer the highest degree of precision, accuracy, reliability, and resolution in the history of the coastal program.

The analysis for the 2007 Coastal Master Plan utilized a suite of modeling tools known as the Coastal Louisiana Ecosystem Assessment and Restoration (CLEAR), developed in the early 2000s to predict the response of the ecosystem to restoration projects by utilizing several modules (hydrodynamic, land-building, habitat switching, habitat use, and water quality). In 2006, some improvements were made to the CLEAR model framework, primarily by incorporating new data, and CLEAR was utilized for the 2007 Coastal Master Plan. The 2007 Coastal Master Plan analysis was the first to evaluate both hurricane protection and wetland restoration projects together.

The modeling strategy for the 2012 Coastal Master Plan was to build on existing modeling capacities, when possible, but also to incorporate resource limitations, such as sediment and water, and scenarios on scientific uncertainties, such as subsidence and sea level rise. In addition, a more thorough predictive evaluation of hurricane protection projects was needed. The CPRA relied on a team of over 60 scientists and engineers to develop a series of integrated, coastwide predictive models and a computer-based decision support tool. The models were used to estimate the individual and cumulative effects of hundreds of projects on the landscape and ecosystem and the level of impact/risk to communities.

The state is currently improving the 2012 models for use in the upcoming 2017 Coastal Master Plan. Improvements from the 2012 model suite to the 2017 model suite include the incorporation of new data, more spatially refined hydrologic models, improved modeling of sediment distribution, incorporation of marsh edge erosion in model, additional vegetative communities added to the vegetation model, and development of a barrier shoreline model.

In addition to the model improvements being made for the 2017 Master Plan, CPRA is also working with The Water Institute of the Gulf, USACE, and others to develop basin-wide multi-dimensional modeling tools that will provide unprecedented predictive capability with respect to the outcomes of sediment diversion projects. Unlike previous modeling tools, these tools will predict effects in both the Mississippi River and the receiving basins on such important parameters as salinity, sediment, land building, water level, and other parameters.

These hydrodynamic models will also be linked to vegetation, fish, shellfish, and nutrient models to provide information on those parameters.

To ensure that this work is informed by the most current national and international science, the CPRA relies on a network of subject matter experts to provide advice and guidance on technical issues related to the implementation of the Coastal Master Plan. These experts may provide general oversight and guidance, such as the Master Plan Framework Development Team, or they may provide very specific recommendations for moving particular projects forward, such as the Expert Panel on Diversion Planning and Implementation. We are enlisting the help of the brightest minds in every field to analyze our work and to help develop solutions to coastal challenges.

The Water Institute of the Gulf

In 2011 The Water Institute of the Gulf, a not-for-profit, independent research institute, was created to provide the state of Louisiana with a central resource for science and engineering solutions. The Water Institute fosters innovation in coastal restoration and hurricane protection, building world class expertise in these areas. As the CPRA continues efforts to implement the Coastal Master Plan, The Water Institute provides crucial technical support, including expert analysis, model development and improvement, and applied research – ensuring the best experts, science, and engineering inform our work.

The Water Campus

The Water Campus, located in Baton Rouge, Louisiana, was established to provide a world-class, multi-disciplinary hub for public, private, nonprofit, and academic coastal sectors to work together to develop solutions for challenges facing coastal Louisiana. It has been described as a critical next step in securing the future of our coastal communities and our economy.

The initial phase of development, scheduled to begin in early 2015, will include the dedication of approximately 30 acres of land and the construction of three facilities. The facilities include a new education and research center on the old Baton Rouge municipal dock, a river modeling center, and an office building that will serve as the future home of the CPRA.

Commitment to the Next Generation

The long term success of our efforts to restore and protect Louisiana's coast depends heavily on our ability to prepare the next generation to assume the mantle of leadership on coastal restoration issues. Therefore, the CPRA is diligently investing in the professionals, students, and innovations crucial to sustaining Louisiana's coast through several important initiatives.

Expanded Small Scale Physical Model

Construction has begun on a new facility that will house one of the largest and most accurate moving bed physical models in the world. This new model, sized at 90 feet by 120 feet, will provide qualitative information that will assist in the planning and design of coastal restoration projects. Designed to simulate the Mississippi River's depth, sediment, and flow, the physical model will be used in conjunction with computer modeling to make informed decisions about the best

way to sustain coastal Louisiana. In addition, the new model will serve as a useful tool in helping people to visualize the movement of sediment and water and better understand how the Mississippi River can be used for coastal restoration.

The new facility will also include an interactive exhibit center focused on the achievements and advancements of the coastal program. In addition to showcasing actual projects, the center will highlight the robust science, tools, and community of knowledge and experience supporting the continued growth and development of Louisiana's coastal program. Located on The Water Campus, the new facility will serve as both a formal and informal venue to educate, inspire, and retain the next generation of coastal expertise.

Coastal Innovation Partnership Program and Applied Research Program

The Coastal Innovation Partnership Program (CIPP) solicits and evaluates cutting-edge technologies and other innovations that could be used to achieve the most efficient, cost effective, and sustainable approaches to project implementation, monitoring, and adaptive management. Since the program's inception, an independent panel of nationally-recognized experts has reviewed more than a number of final submissions, ultimately endorsing six innovations for further consideration by the CPRA.

Another way in which the CPRA fosters a culture of innovation is through its Applied Research Program, which provides Louisiana-based researchers with funds to conduct engineering and science research and tool development activities that will enable the CPRA to more effectively protect and restore coastal resources. The program was established in 2013, and has awarding funding

to five Louisiana-based researchers to further studies directly related to the advancement of the coastal program.

Coastal Science Assistantship Program

The Coastal Science Assistantship Program (CSAP) provides assistantships for up to three years to support Louisiana graduate students involved in science or engineering research relevant to coastal protection and restoration efforts. Funding these assistantships allows the CPRA to foster a culture of innovation by directing scientific research to answer questions about planning, designing, constructing, and evaluating coastal projects, thus contributing to the ultimate success of our program.

Since 2008, the CPRA has committed over \$2 million to 36 students from seven Louisiana universities. Graduates of the program have gone on to serve in government, work for area nonprofits, and continue their research via doctoral programs at universities across the nation.

Youth Wetlands Education and Outreach Program

The Youth Wetlands program introduces Louisiana students to the challenges presented by our coastal crisis and the consequences of continued land loss. Teaching students to be aware of their environmental surroundings and encouraging them to become more actively involved in their future is the first step in them becoming better environmental stewards.

CPRA's annual \$500,000 investment in the Youth Wetlands program allows for the development of environmental based lessons plans and teaching materials for grades 4-12. In addition, participating schools are provided with resource

Small Scale Physical Model (SSPM) Rendering | Courtesy of Mougeot Architecture

materials to gain hands-on wetland experience, such as live plants, seeding trays, laboratory supplies, and field materials. During the summer months, participating students are encouraged to attend three summer camps that incorporate the curriculum into hands-on activities. What began as a small program with 178 teachers and 22,000 students has grown to one that touches almost 120,000 students and more than 1,600 teachers statewide.

This year, the CPRA partnered with the Youth Wetlands program to sponsor a Student Poetry Contest. We received more than 400 submissions and chose winners in three categories – Upper Elementary, Middle School, and High School. You can find the winning poems reprinted throughout this year's Annual Plan.

Louisiana's Center of Excellence

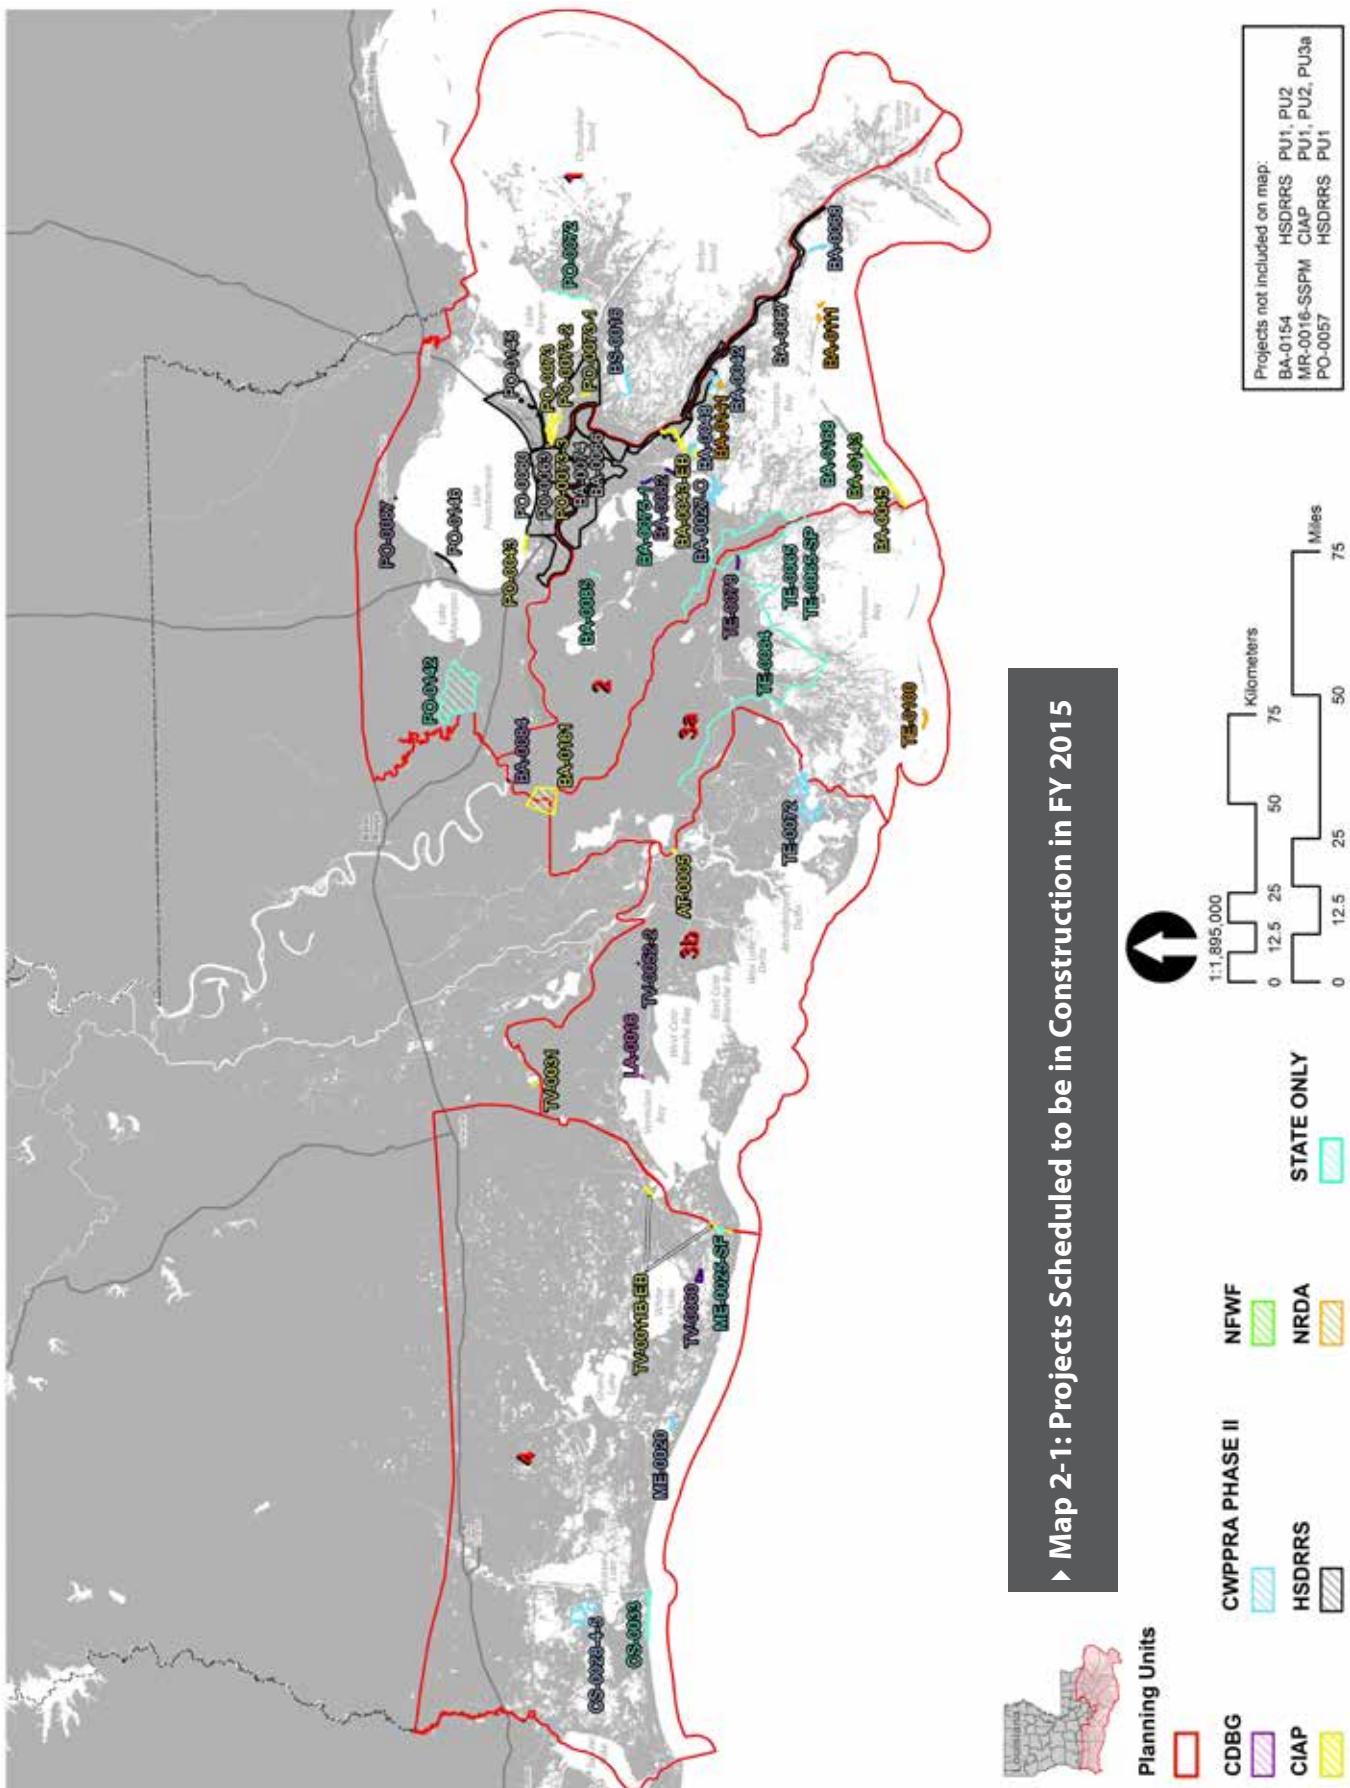

Support for additional advancements in science, technology, and monitoring are anticipated through the Centers of Excellence Research Grants Program established through the RESTORE Act. Louisiana's Center of Excellence will receive a portion of 2.5% of the total funds directed into the Gulf Coast Restoration Trust Fund. The Louisiana Center of Excellence will be responsible for developing a program to competitively distribute grants to conduct research relevant to Coastal Louisiana with an emphasis on advancing Louisiana's Coastal Master Plan.

Section 3
FY 2016
Implementation Plan:
More Projects, More
Action, More Results

Congratulations to the Middle School Division winners of the CPRA and Youth Wetlands Program's inaugural Student Poetry Contest.

"Fading Isle"

1st Place

Papa closed his eyes as if to recapture
the carefree days of his childhood
the scenic drive down Hwy. 1 to Grand Isle
towering oak trees, brown pelicans, blue heron, snowy egrets
welcoming weekend families along the seven mile stretch
dawn brings the first of many fishing adventures on
"the island"
specs, black drum, sheepshead
long treks through the marsh, scooping up shrimp
carefully looking out for cotton mouths and alligators
evenings spent swatting mosquitos, catching lightning bugs
falling asleep in the hammock listening to stories of Jean Lafitte
Like papa, who loved it so much
"the island"
fades away

*By: Daniel Guillie, Age 14
River Ridge, La.*

"The Place I Love the Most"

3rd Place

There is a place, a place meant for me,
We call it a Gulf, get it straight, not the sea.
Waves splash against boats, a magnificent sight,
Brown pelicans and other birds take off in flight.
Fish swim beneath its unpredictable surface.
When I come out on a boat, I can't feel nervous.
Hot sun beats down, giving new freckles and burning my face,
I love the way the air smells in this place.

I sit in a tree at our camp, at the coast,
Deciding this is the place, that I love the most.
From my rope swing that hangs from the old oak trees,
To the bayou's Spanish Moss and cypress knees.
From oyster shells that litter lost lives on levees,
To fresh fried fish, makes us crumbly and messy.
From shrimp boats filled with shrimp, with help from above.
To our shed that sits in the water because of a hurricane's
love.

Could all this be gone, the love, the culture, the food?
Could all just vanish by my child's first moon?
Our coast defines us, makes Louisiana what we are,
Why do we let it fall like a dying star?
This land is our home, this our coast.
It's the place all Louisianians love the most.

*By: Emma Beauchamp, Age 14
Saint Francisville, La.*

"Wetlands: Guardian of Louisiana"

2nd Place

The coast,
full of drips and drops
mingled with the buzzing and clicking
of the insects of the thick, deep wild.

The spongy ground,
that sinks beneath your boot,
like the flesh of a sleeping animal,
lounging in the shade.

The coast,
a storm buffer to the fragile cities
that lie behind the green trees,
hung with gray moss.

The great protector of the exposed and naked
civilization of internet and coffee shops,
of loved ones and your mother's famous
Louisiana jambalaya, as you sit around the table
on a warm summer night.

The coast,
full of wet and wild life,
flourishing in the dense and muggy air.

That Louisiana wetland coast,
my home.

New Orleans, La.*

Section 3

FY 2016 Implementation Plan: More Projects, More Action, More Results

Project Status Summaries

This section presents an implementation plan that describes the state's proposed investment in coastal restoration and protection during FY 2016 (July 1, 2015, through June 30, 2016). Included are all of the coastal protection and restoration projects in which the state will participate. Projected schedules and budgets are estimates based on the most recent available information.

This implementation plan presents the status of state coastal projects according to the four phases traditionally used to track projects: 1) planning; 2) design; 3) construction; and 4) operation, maintenance, and monitoring (OM&M). Below are summaries of project status by phase; Appendices A and B provide additional details about the projects. The current status of individual projects is presented by authorizing program in the project schedules in the Coastal Program Details section. Readers are referred to the state's coastal website (<http://coastal.la.gov/>) for additional details about specific projects. Regional maps of projects in planning, design, and/or construction in FY 2016 are presented in Figures 3-1 through 3-3.

Projects in Planning

The planning team identified five projects in the planning phase in FY 2016, including two restoration projects, one navigation project, and two integrated protection and restoration projects. These projects, together with other non-project planning initiatives, represent a total state investment of \$25 million in FY 2016, and will proceed to design and construction according to their authorizing program as discussed in the Coastal Program Details section.

Projects in Design

The planning team identified 29 projects in design for FY 2016, including four protection projects and 25 restoration projects. These projects represent a total state investment of \$74 million in FY 2016. The path these projects will take to construction varies according to the authorizing program as described in the Coastal Program Details section.

Projects Under Construction

The planning team identified 43 projects that will begin or continue construction in FY 2016, including 18 protection projects, 24 restoration projects, and one infrastructure project. These projects represent a total state investment of \$503 million in FY 2016, and 20 of these projects are projected to complete construction in FY 2016. Table 3-1 presents additional information about projects set for construction in FY 2016, and Figure 3-4 provides a map with the locations of these projects.

Constructed Projects in Operation, Maintenance, and Monitoring

The CPRA will expend approximately \$99 million (including federal match dollars) in FY 2016 on operation, maintenance, and monitoring (OM&M). OM&M expenditures in FY 2016 will cover the operation and maintenance of 130 projects and monitoring of 100 projects. OM&M expenditures also include approximately \$10 million (in state and federal funds) for monitoring coast-wide conditions using CRMS-Wetlands (<http://www.lacoast.gov/crms2/Home.aspx>). Finally, the state will expend approximately \$1.6 million in FY 2016 to engage in marine debris removal in offshore areas and will pursue \$45.8 million in the repair of beach and dune projects that were damaged by Hurricane Isaac. These expenditures are reimbursable by the Federal Emergency Management Agency (FEMA). Figure 3-5 provides a map with locations of all projects with OM&M expenditures in FY 2016. Project-specific OM&M expenditures are presented in Appendix B. The Barrier Island Status Report (Appendix C) is available online for review (www.coastal.la.gov). The Operating Plans for the Caernarvon and Davis Pond diversions during calendar year 2015 (Caernarvon Operational Plan for 2015 and Davis Pond Operational Plan for 2015) are contained in Appendix D.

Ongoing Programs

The state operates six ongoing programs. These efforts provide supporting research, financial assistance, additional project benefits or educational support for our protection and restoration program.

Adaptive Management

The Coastal Master Plan process recognizes that we need to quickly implement large scale projects within an extremely dynamic environment. We will continue to build on the decades of research and analysis performed to date, but we must move forward to maximize riverine resources even though our science may be imperfect. In so doing we must establish and maintain a robust adaptive management program that will allow us to modify constructed projects and inform the development of future projects.

The projects discussed above are authorized through multiple programs, each of which entails different processes to proceed through implementation. Summaries of coastal programs with active projects are presented below. Detailed projected expenditures are presented in Appendix B by program.

Coastal Wetlands Planning, Protection and Restoration Act (CWPPRA)

CWPPRA was authorized by Congress in 1990 to identify, prepare, and fund construction of coastal wetlands restoration projects. CWPPRA is managed by a Task Force comprised of the state and five federal agencies, including the Environmental Protection Agency (EPA), the U.S. Fish and Wildlife Service (USFWS), the Natural Resources Conservation Service (NRCS), the National Marine Fisheries Service (NMFS), and the USACE. The CWPPRA Task Force evaluates

projects proposed for inclusion in the CWPPRA program and prepares a ranked list of candidate projects annually based on cost-effectiveness, longevity, risk, supporting partnerships, public support, and support of CWPPRA goals. From this ranked list, the Task Force selects a final list of projects, the Priority Project List (PPL), for implementation.

Following project selection, CWPPRA projects proceed through a two-phased implementation process. Phase 1 consists of Engineering and Design, an in-depth process by which engineers and biologists further develop and assess project features and effects. After design, these projects will be considered for construction, which begins upon Phase 2 approval by the Task Force. Phase 2, referred to as Construction and Monitoring, involves the actual building and subsequent OM&M of the project. The state will expend funds in FY 2016 on the implementation of 17 CWPPRA Phase 1 projects (design) and eight CWPPRA Phase 2 projects (design and construction).

Examples of active CWPPRA projects include the following:

- Northwest Turtle Bay Marsh Creation (BA-125) (Phase 1)
- Cole's Bayou Marsh Creation (TV-63) (Phase 1)
- South Lake Lery Marsh Creation (BS-16) (Phase 2)
- Bayou Dupont Marsh and Ridge Restoration (BA-48) (Phase 2)

Project schedules for CWPPRA projects are included in Table 3-2. Additional information about CWPPRA projects is available on the CWPPRA website (www.lacoast.gov). Project-specific CWPPRA expenditures are presented in Appendix B. The federal cost-share for CWPPRA projects is 85 percent of the total project cost, with the state assuming responsibility for the remaining 15 percent of the cost. The state's contribution must include a cash payment of not less than five percent of the total project cost. The remainder of the state's contribution may take the form of lands, easements, or rights-of-way, or any other form of in-kind contribution determined to be appropriate by the lead Task Force member. Cost-share agreement conditions for CWPPRA projects vary according to the Federal partner.

Water Resources Development Act (WRDA)

The state is partnered with the USACE on multiple large-scale protection and restoration projects and studies that have been authorized through past WRDA bills. WRDA refers to any of a set of public laws enacted by Congress to address various aspects of water resources including environmental, structural, navigational, flood protection, and hydrologic issues.

The state currently intends to expend funds in FY 2016 on several WRDA authorizations, including:

- Mississippi River Hydrodynamic and Delta Management Study (MR-16)
- Southwest Coastal Louisiana Feasibility Study (LA-20)

Schedules for these projects are presented in Table 3-3. Additional information about these projects is available at www.lca.gov.

Coastal Impact Assistance Program (CIAP)

CIAP was authorized in 2005 as part of the Federal Energy Policy Act to help six coastal states mitigate the onshore effects of Outer Continental Shelf (OCS) oil and gas development. CIAP will provide approximately \$495.6 million to Louisiana from the federal administrator, the USFWS. The state will receive 65 percent of these funds with the remaining 35 percent being distributed to the 19 coastal parishes. To date, all \$495.6 million of Louisiana's CIAP funds have been awarded for the implementation of 99 projects.

Authorized uses of CIAP funds include projects and activities to conserve, protect or restore coastal areas, including wetlands; mitigation of damage to fish, wildlife or natural resources; planning assistance and the administrative costs of CIAP compliance; implementation of a federally approved marine, coastal or comprehensive conservation management plan; and onshore infrastructure projects and public service needs. Up to 23 percent of those funds can be spent on CIAP planning assistance and compliance and for onshore infrastructure projects and public service needs to mitigate OCS impacts.

The current approved Louisiana CIAP Plan identifies a total of 99 State-only, State/Parish-shared, and Parish-only funded projects for which these funds were allocated.

The state will expend funds on the design and/or construction of 10 CIAP projects in FY 2016, including nine restoration projects and one infrastructure project. CIAP funds will also continue to be used to fund the CFCI program and two Performance Evaluation studies of constructed CIAP projects.

Active CIAP projects include:

- Mississippi River Long Distance Sediment Pipeline (BA-43 [EB])
- Mississippi River Water Introduction into Bayou Lafourche (BA-161)
- Living Shoreline Protection Demonstration Project (PO-148)
- Falgout Canal Freshwater Enhancement (TE-63)

Project schedules for CIAP projects are included in Table 3-4. Additional information about these projects is available on the state's coastal website. Project specific expenditures for CIAP projects are presented in Appendix B.

Projects within the approved CIAP plan are funded for implementation by approval of CIAP grant applications which were submitted to USFWS for approval and were required to be submitted separately for the design and construction phases of a project. Once the grant application is approved, the CIAP projects are authorized and the phase of the project is funded. Once the design of the project is completed, applications for the construction phase can be submitted. Once the construction grant application is approved, the project is fully funded and will proceed to construction according to its schedule. Principal causes for the delay of CIAP projects include grant delays, land rights issues, permitting issues, and most recently the transfer of the federal administration of CIAP.

State-Only Projects

The Louisiana Legislature allocated \$790 million in state budget surpluses for the years 2007, 2008, and 2009 for coastal protection and restoration activities. The state is utilizing these funds to expedite its coastal program by funding ongoing programs, developing initiatives, and implementing protection and restoration projects. The overwhelming majority of these funds have been allocated to project implementation. Surplus funds have been used to supplement projects that are authorized through one of the other programs described in this section (e.g., Mississippi River Long Distance Sediment Pipeline [BA-43 (EB)], Southwest Coastal Louisiana Feasibility Study [LA-20]) and implement other State-only projects. The state has also begun implementation of other projects without a federal partner using Trust Fund revenues. The state will expend funds in FY 2016 on 15 State-only projects, including 12 protection projects, one restoration project, one navigation project, and one integrated protection and restoration project.

Broadly speaking, State-only projects generally involve one of the following categories:

- Expedited construction of components of federal protection projects (e.g., Larose to Golden Meadow [TE-65], Morganza to the Gulf [TE-64]);
- Coordination on federal protection projects;
- Feasibility studies for flood protection in areas not currently covered by the existing federal protection network (e.g., South Central Coastal Plan [TV-54]);
- Protection and restoration projects not included in one of the other coastal programs that are to be implemented in conjunction with local parishes (e.g., Jean Lafitte Tidal Protection [BA-75-1], Morgan City/St. Mary Flood Protection [TV-55]).

A total of \$293.3 million in 2008 and 2009 was allocated to cover LERRDS cost for the Greater New Orleans Hurricane Protection System. Included within this total is \$193.3 million from Act 20 of the 2009 Regular Legislative Session that was approved for Southeast Louisiana Hurricane Protection projects. This includes credits and payments toward the state and levee district match requirements for the estimated \$15 billion Hurricane and Storm Damage Risk Reduction System (HSDRRS) work underway. The non-federal cost share of such work is estimated to be \$1.8 billion plus applicable interest. Under the plan, an additional \$40 million of these funds may be utilized to advance planning, design, and construction of hurricane protection and flood control projects in southeast Louisiana. These investments will match local and federal funds while improving the protection of our most vulnerable communities consistent with the Master Plan. These funds are projected to be expended in their entirety by the end of FY 2017.

Project schedules for State-only projects are included in Table 3-5. Project-specific expenditures for State-only projects are presented in Appendix B.

Of the 15 active State-only projects, 11 are funded for construction and will proceed to construction in accordance with their schedules as presented in Table 3-5. Two projects are funded for design and following completion of design will

proceed to construction upon procurement of construction funds. The remaining projects are funded for feasibility only and would proceed to design upon receipt of further authorization through another coastal program.

Community Development Block Grants (CDBG)

Louisiana received \$1.06 billion from HUD's CDBG program to assist in the recovery from Hurricanes Gustav and Ike. The vast majority of CDBG funds were allocated to the 19 coastal parishes for use in protecting their communities and infrastructure. However, included within the \$1.06 billion was an allocation of \$27.4 million to the Louisiana Office of Community Development-Disaster Recovery Unit (OCD-DRU) for state coastal protection and restoration projects that will help communities recover from the 2008 hurricanes and prepare to withstand future hurricanes with greater resilience. The state, in partnership with local interests, identified potential flood protection and restoration projects that could be implemented with these CDBG funds in all major regions of coastal Louisiana, including floodgate installation; levee construction or improvement to reduce storm surge impacts to coastal communities and critical infrastructure; and shoreline protection to benefit communities and related infrastructure and recreational facilities. HUD subsequently approved nine projects for CDBG funding.

Project schedules for CDBG projects are included in Table 3-6. Project-specific expenditures for CDBG projects are presented in Appendix B.

All active state CDBG projects are funded for construction and will proceed to construction in accordance with their schedules as presented in Table 3-6. State CDBG projects require an agreement with the local sponsor, where the local sponsor is responsible for ownership and OM&M costs after project completion. Project implementation requires submittal of an application to OCD-DRU for final approval and funding. Applicant projects are reviewed by OCD-DRU for consistency with program objectives and criteria. Potential issues that could affect CDBG project implementation include design issues, land rights issues, environmental compliance issues, and permitting issues.

Hurricane and Storm Damage Risk Reduction System

HSDRRS was authorized by PL 109-234, Emergency Supplemental Appropriations Act for Defense, the Global War on Terror, and Hurricane Recovery, 2006, and includes the West Bank and Vicinity project, the Lake Pontchartrain and Vicinity project, the IHNC Lake Borgne Surge Barrier and IHNC Seabrook Complex (each of which is managed separately). Each of these projects is in turn comprised of multiple segments, which have separate design and construction schedules. HSDRRS also covers multiple restoration projects that are currently under development as mitigation for wetland impacts associated with construction of hurricane protection projects. As the non-federal sponsor along with the local levee authorities and levee districts, the state has contributed to the West Bank and Vicinity and Lake Pontchartrain and Vicinity projects through plans and specifications review, construction inspection assistance, project and program management, and payment of LERRDS costs. Beginning in FY 2017 the non-federal sponsor is anticipated to begin its 30 year payback to the federal government for the non-federal sponsor's cost-share portion of construction

costs (approximately 35 percent). Schedules for HSDRRS projects are included in Table 3-7. All but one of these projects are fully funded for construction and will proceed with construction according to the schedules provided in Table 3-7. The principal issues that affect HSDRRS projects include engineering, constructability, budget and time issues.

Non-State Projects

Act 545 of the 2008 Legislature mandates that State Annual Plans include descriptions of all projects and programs relating to hurricane protection, restoration, and infrastructure in coastal Louisiana, including federal-only projects, local parish and levee district projects, and those privately funded wetland enhancements and activities that require a Coastal Use Permit. Appendix E contains an inventory of non-state projects identified through outreach to coastal parishes and levee districts to obtain information on local, non-state coastal projects. Appendix E also includes an inventory of proposed local projects as presented in coastal parish Master Plans. These proposed projects represent desired local investment in protection and restoration activities. Appendix E also presents information on federal coastal protection projects for which local parishes or levee districts serve as the local sponsor. Finally, Appendix E presents information on non-state projects that have received State Restoration Partnership grants to support implementation. Adding non-state projects to this inventory will be a priority in future years as the state continues to gather information about non-state coastal protection and restoration efforts.

Deepwater Horizon Oil Spill Restoration Planning

Although the timing and amount of funds related to the *Deepwater Horizon* (DWH) oil spill have not been fully determined, a number of projects have been identified to receive spill-related funding as the oil spill damage assessment and restoration planning continues. With an understanding that the use of restoration funds will be guided by specific criteria, Louisiana is committed to maximizing its investment in oil spill recovery activities by implementing restoration projects that are consistent with the Coastal Master Plan to the extent possible. Schedules for projects that may be implemented for DWH oil spill restoration planning are presented in Table 3-8. Project specific expenditures are presented in Appendix B.

Natural Resource Damage Assessment (NRDA) Restoration

The Natural Resources Damage Assessment (NRDA) is the process used by natural resource trustees to develop, on behalf of the public, their claim for natural resource damages against the responsible party or responsible parties for the spill. Through that claim, the trustees will seek compensation in the form of restoration for the harm done to natural resources and services. The overall goal of NRDA is to make the environment and public whole by restoring natural resources to their pre-spill conditions, and providing compensation for the loss of those resources from the dates of injury through full restoration. The assessment process is lengthy and complex. The NRDA will continue until the natural resource trustees have determined the full extent of damages, restoration plans are designed and implemented, and the environment and public are made whole for injuries to natural resources and services resulting from the *Deepwater Horizon* oil spill.

NRDA Early Restoration

In April 2011, the Trustees and BP announced an agreement under which BP committed to provide \$1 billion toward the implementation of early restoration projects. The agreement represents an initial step toward fulfilling the BP's obligation as a responsible party to fund the complete restoration of natural resources. Early restoration provides an opportunity to implement restoration projects prior to the completion of the natural resource damage assessment process.

The Trustees finalized Phase III of early restoration in October 2014, approving 44 projects gulf wide totaling \$627 million. With the finalization of Phase III, approximately \$698 million in early restoration funds have been allocated for projects across the Gulf, including \$370 million for projects in Louisiana. The Louisiana projects include:

- Lake Hermitage Marsh Creation – NRDA Early Restoration Project (\$14.4 M)
- Louisiana Oyster Cultch Project (\$15.6 M)
- Louisiana Outer Coast Restoration (\$318 M)
 - Caillou Lake Headlands (Whiskey Island) (\$110 M)
 - Shell Island West (\$101 M)
 - Chenier Ronquille (\$35 M)
 - North Breton Island (\$72 M)
- Louisiana Marine Fisheries Enhancement, Research, and Science Center (\$22 M)

BP and Transocean Criminal Settlements

In early 2013, a U.S. District Court approved two plea agreements resolving the criminal charges against BP and Transocean related to the *Deepwater Horizon* disaster. The agreements directed a total of \$2.54 billion to the National Fish and Wildlife Foundation (NFWF) for natural resources restoration in the Gulf of Mexico. Over the next five years, NFWF's newly established Gulf Environmental Benefit Fund will receive approximately \$1.27 billion to "create or restore barrier islands off the coast of Louisiana and/or to implement river diversion projects on the Mississippi and/or Atchafalaya Rivers for the purpose of creating, preserving and restoring coastal habitat."

NFWF

To date, NFWF has awarded over \$221 million from the Gulf Environmental Benefit Fund for projects in Louisiana. This includes funds awarded in April 2014 for the construction of the second increment of the Caminada Beach and Dune Restoration project and funds for adaptive management awarded in November 2014. The Louisiana Projects include:

- Adaptive Management: Louisiana River Diversions and Barrier Islands (\$13.2 M)

- Caminada Beach and Dune Increment II
 - Engineering and Design (\$2.7 M)
 - Construction (\$144.5 M)
- East Timbalier Island: Engineering and Design (\$5.6 M)
- Mid-Barataria Sediment Diversion: Engineering and Design (\$37.7 M)
- Lower Mississippi River Sediment Diversions: Planning (\$12.8 M)
- Increase Atchafalaya Flow to Terrebonne: Planning (\$4.6 M)

Clean Water Act Penalties

The Clean Water Act (CWA) establishes the basic structure for regulating discharges of pollutants into the waters of the United States and regulating water quality standards for surface waters. The CWA makes it unlawful to discharge any pollutant from a point source into navigable waters, unless a permit is obtained. Violations of the CWA can result in both civil and criminal prosecutions by the federal government. The U.S. Department of Justice (DOJ), on behalf of the Environmental Protection Agency (EPA), the United States Coast Guard (USCG), or another federal agency, may bring enforcement actions for civil or criminal penalties under the CWA.

RESTORE Act

In June 2012, Congress proactively passed the RESTORE Act, which dedicates 80 percent of all prospective CWA administrative and civil penalties related to the *Deepwater Horizon* spill to a Gulf Coast Restoration Trust Fund. The RESTORE Act also outlines a structure by which the funds can be utilized to restore and protect the natural resources, ecosystems, fisheries, marine and wildlife habitats, beaches, coastal wetlands, and economy of the Gulf Coast region.

The RESTORE Act outlines the following framework for allocation of the Trust Fund:

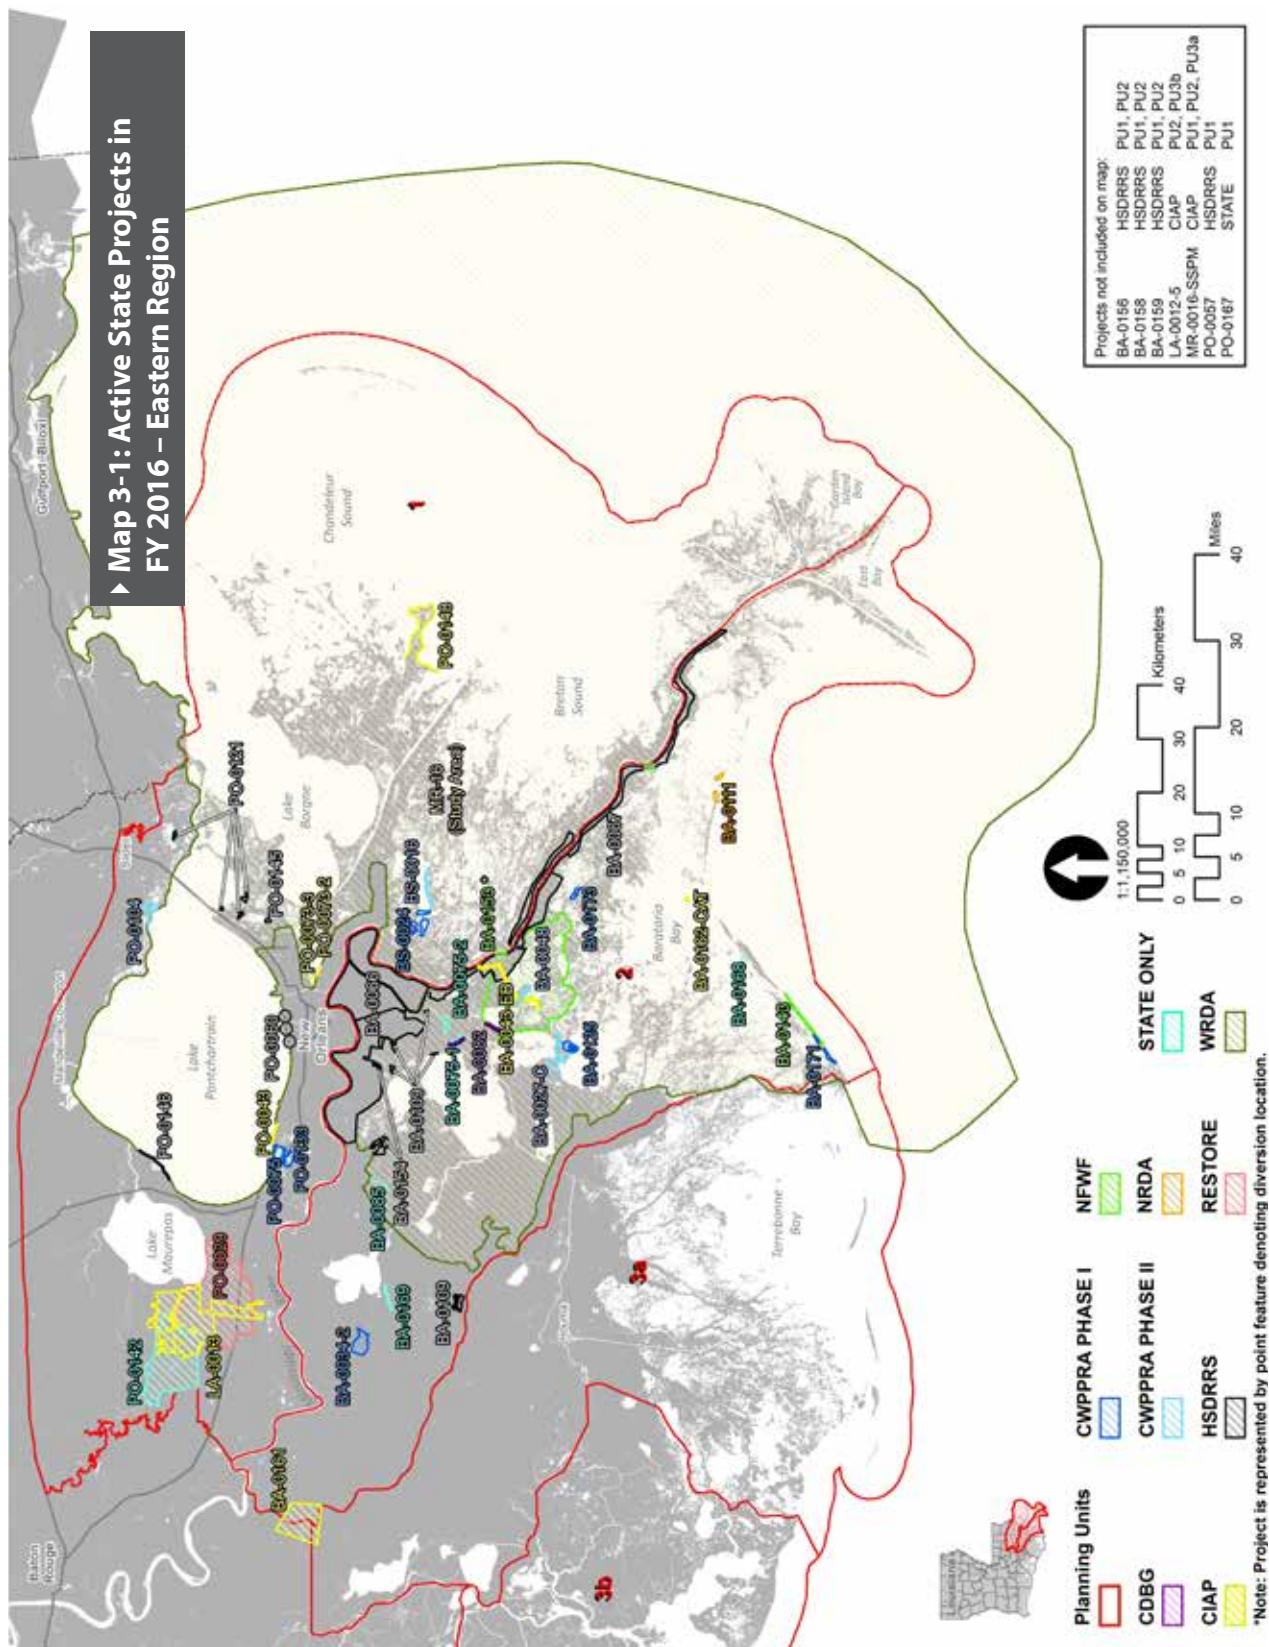

- 35 percent equally divided among the five States for ecological restoration, economic development, and tourism promotion (Direct Component);
- 30 percent plus interest managed by the Council for ecosystem restoration under the Comprehensive Plan (Council-Selected Component);
- 30 percent divided among the States according to a formula to implement state expenditure plans, which require approval of the Council (Spill Impact Component);
- 2.5 percent plus interest for the Gulf Coast Ecosystem Restoration Science, Observation, Monitoring and Technology Program within the Department of Commerce's National Oceanic and Atmospheric Administration (NOAA); and
- 2.5 percent plus interest allocated to the States for Centers of Excellence Research grants, which will each focus on science, technology, and monitoring related to Gulf restoration.

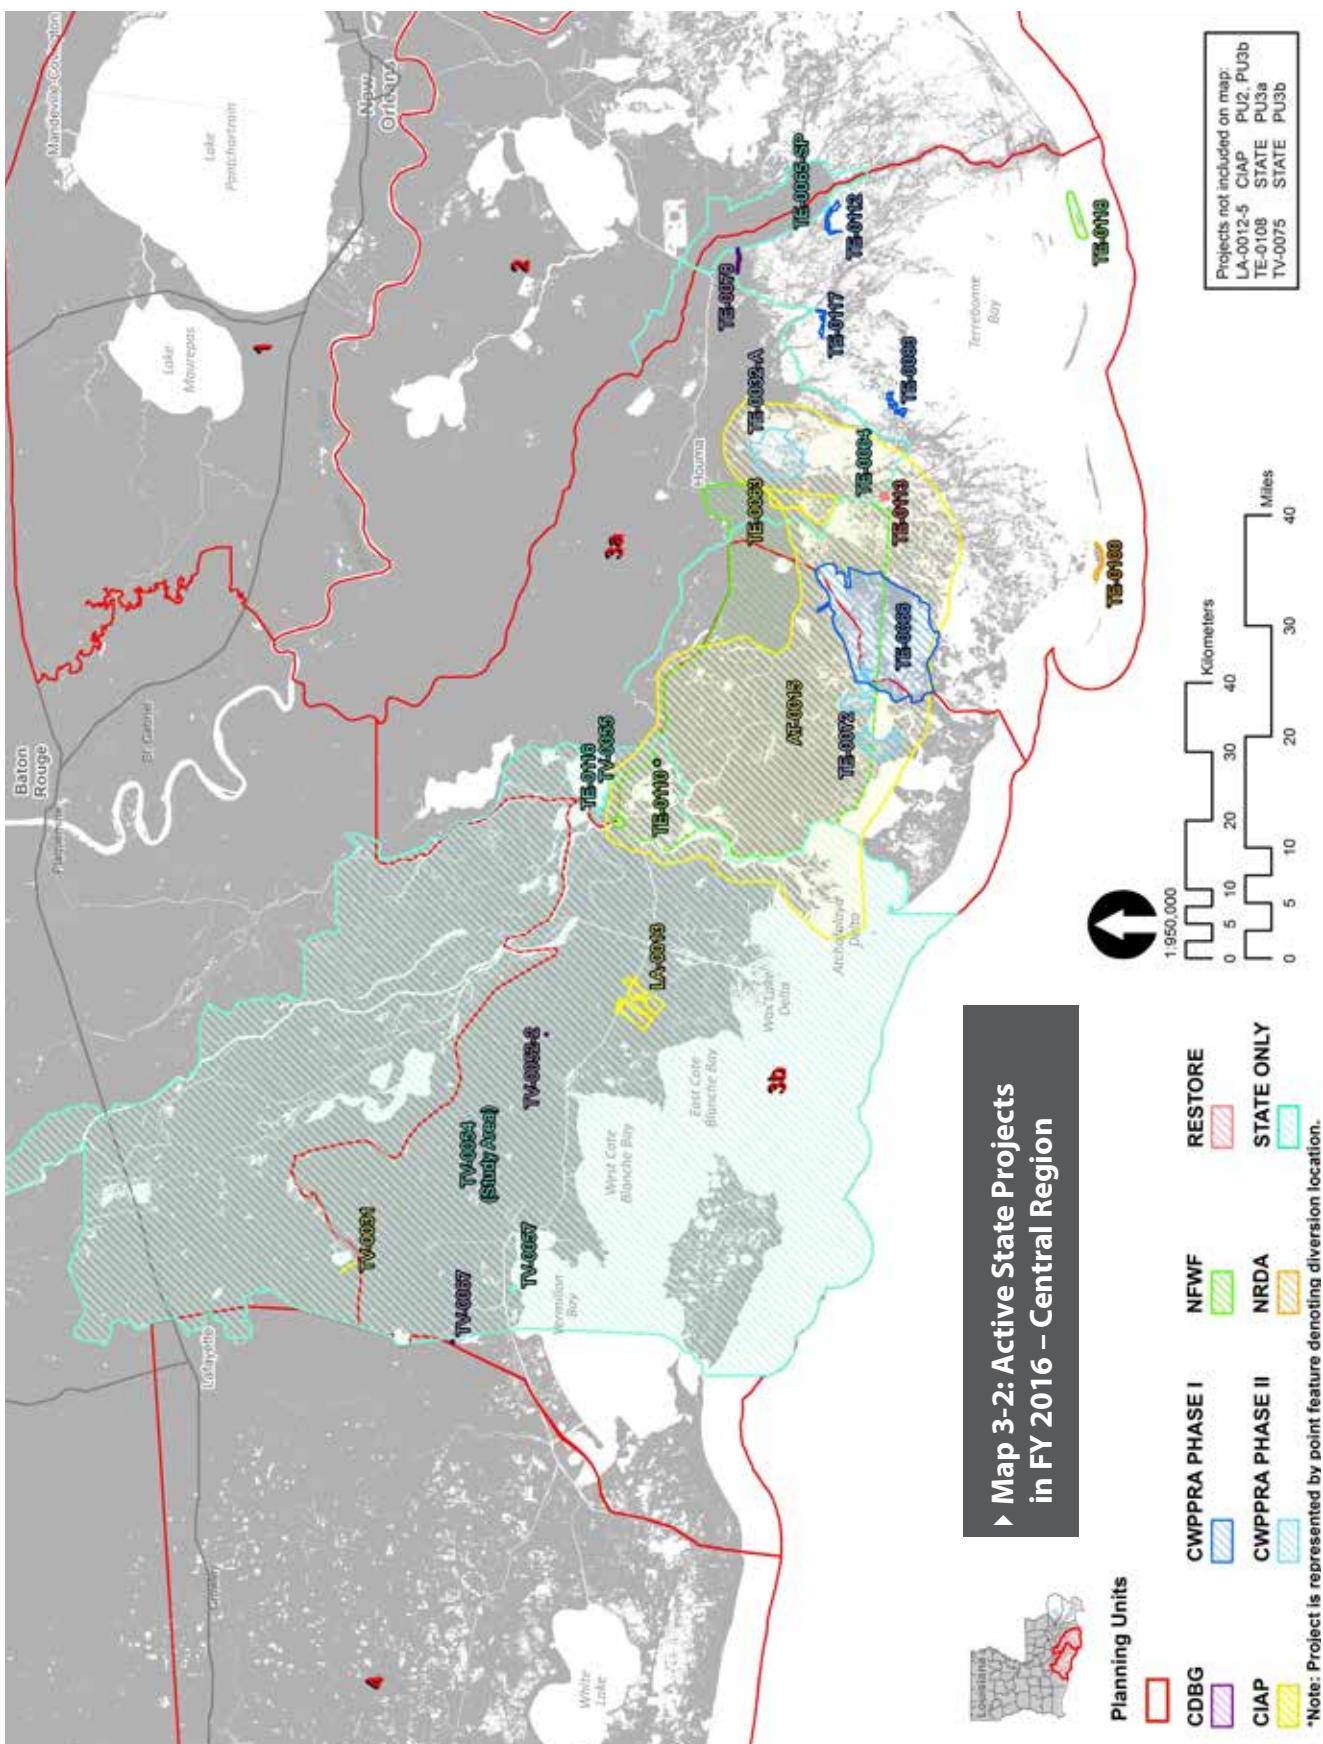

In February 2013, Transocean agreed to pay \$1 billion to resolve federal CWA civil penalties. The total amount of BP's CWA civil penalties will ultimately be determined by the final phase of the civil trial which began in January 2015.

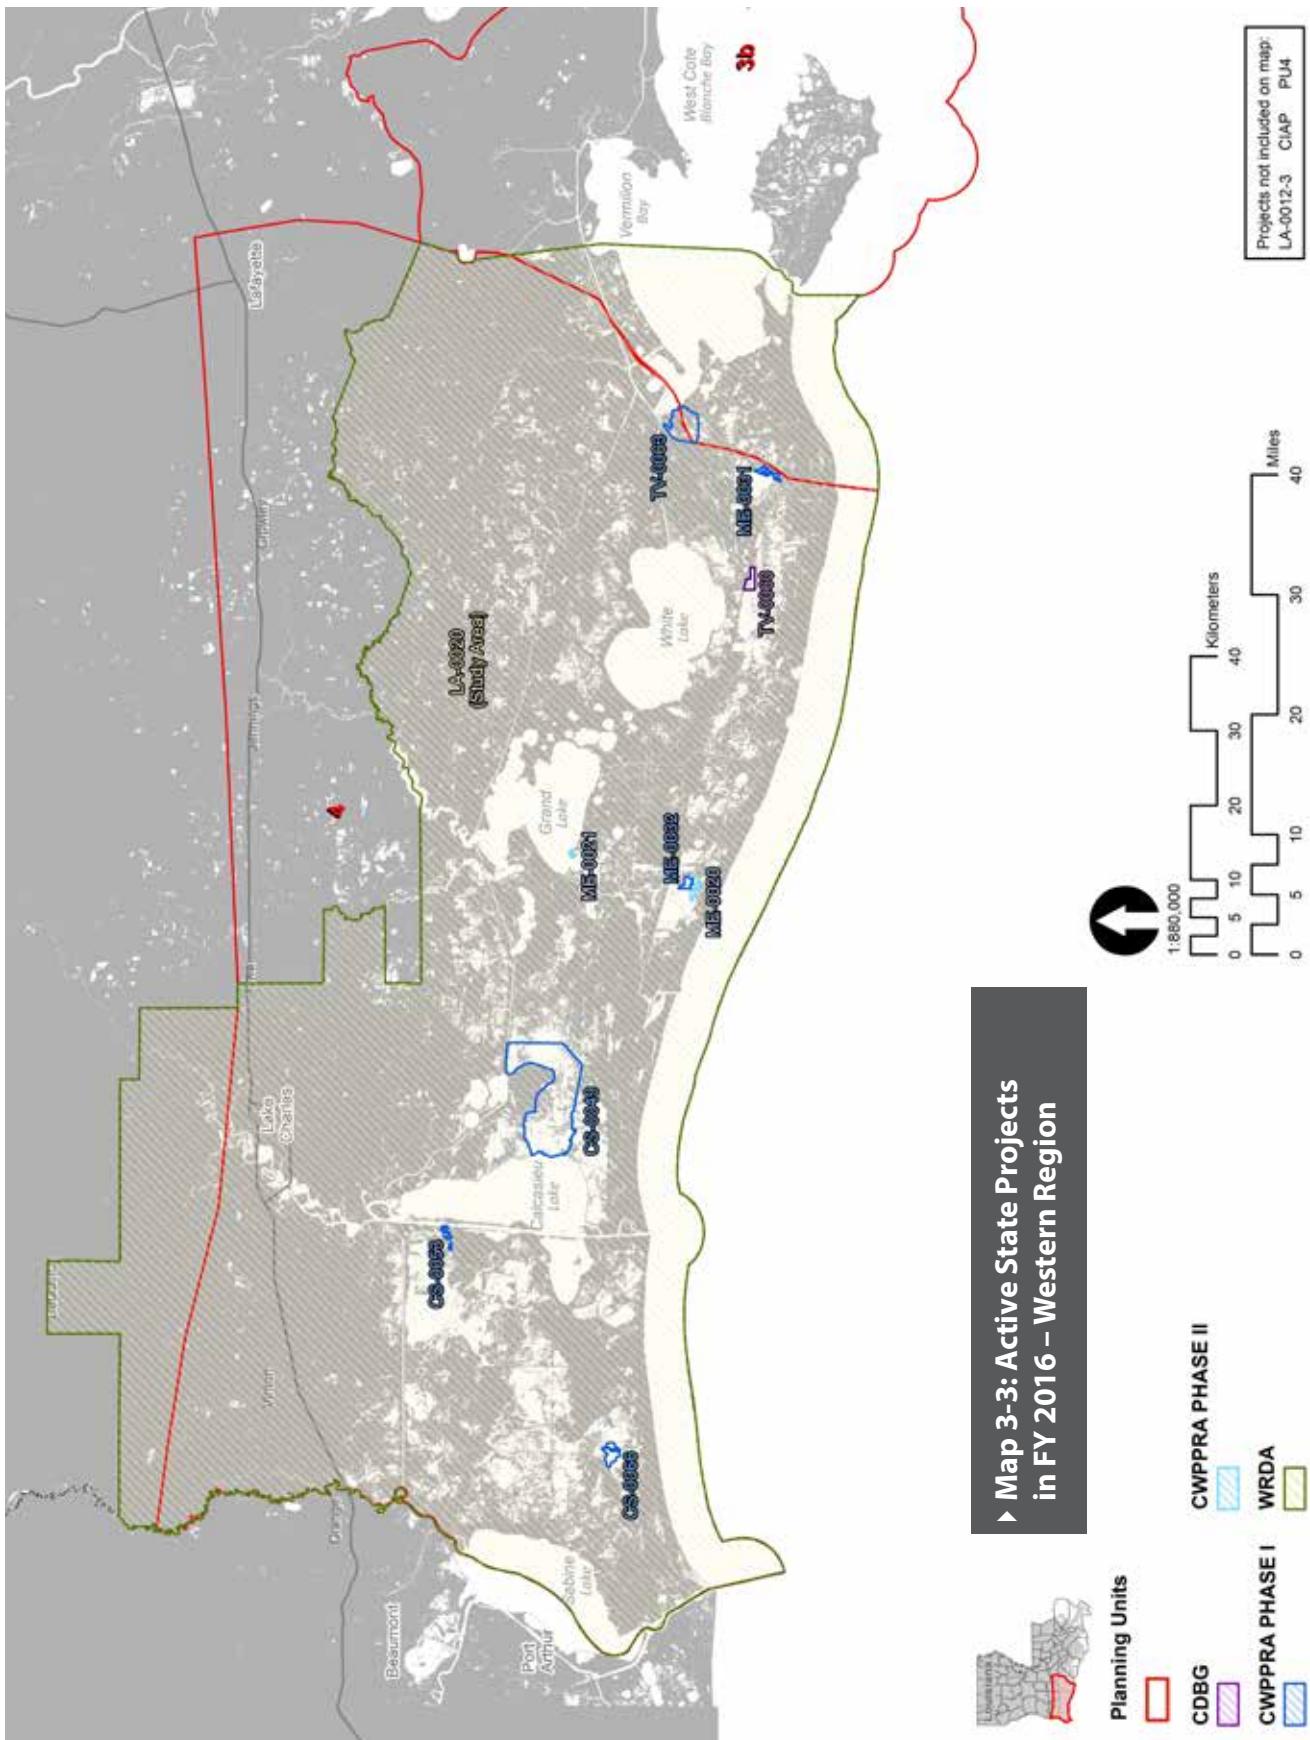

Council-Selected Restoration Component Projects

In November 2014, Louisiana submitted the following five projects to the Gulf Coast Ecosystem Restoration Council for consideration under the first phase of funding for the Council-Selected Restoration Component of the RESTORE Act.

- Golden Triangle Marsh Creation Project (Funding Request: \$4.4 M)
- Mississippi River Reintroduction into Maurepas Swamp (Funding Request: \$14.2 M)
- Biloxi Marsh Living Shoreline Project (Funding Request: \$3.2 M)
- West Grand Terre Beach Nourishment and Stabilization Project (Funding Request: \$7.3)
- Lower Mississippi River Management Program (Funding Request: \$16.1 M)

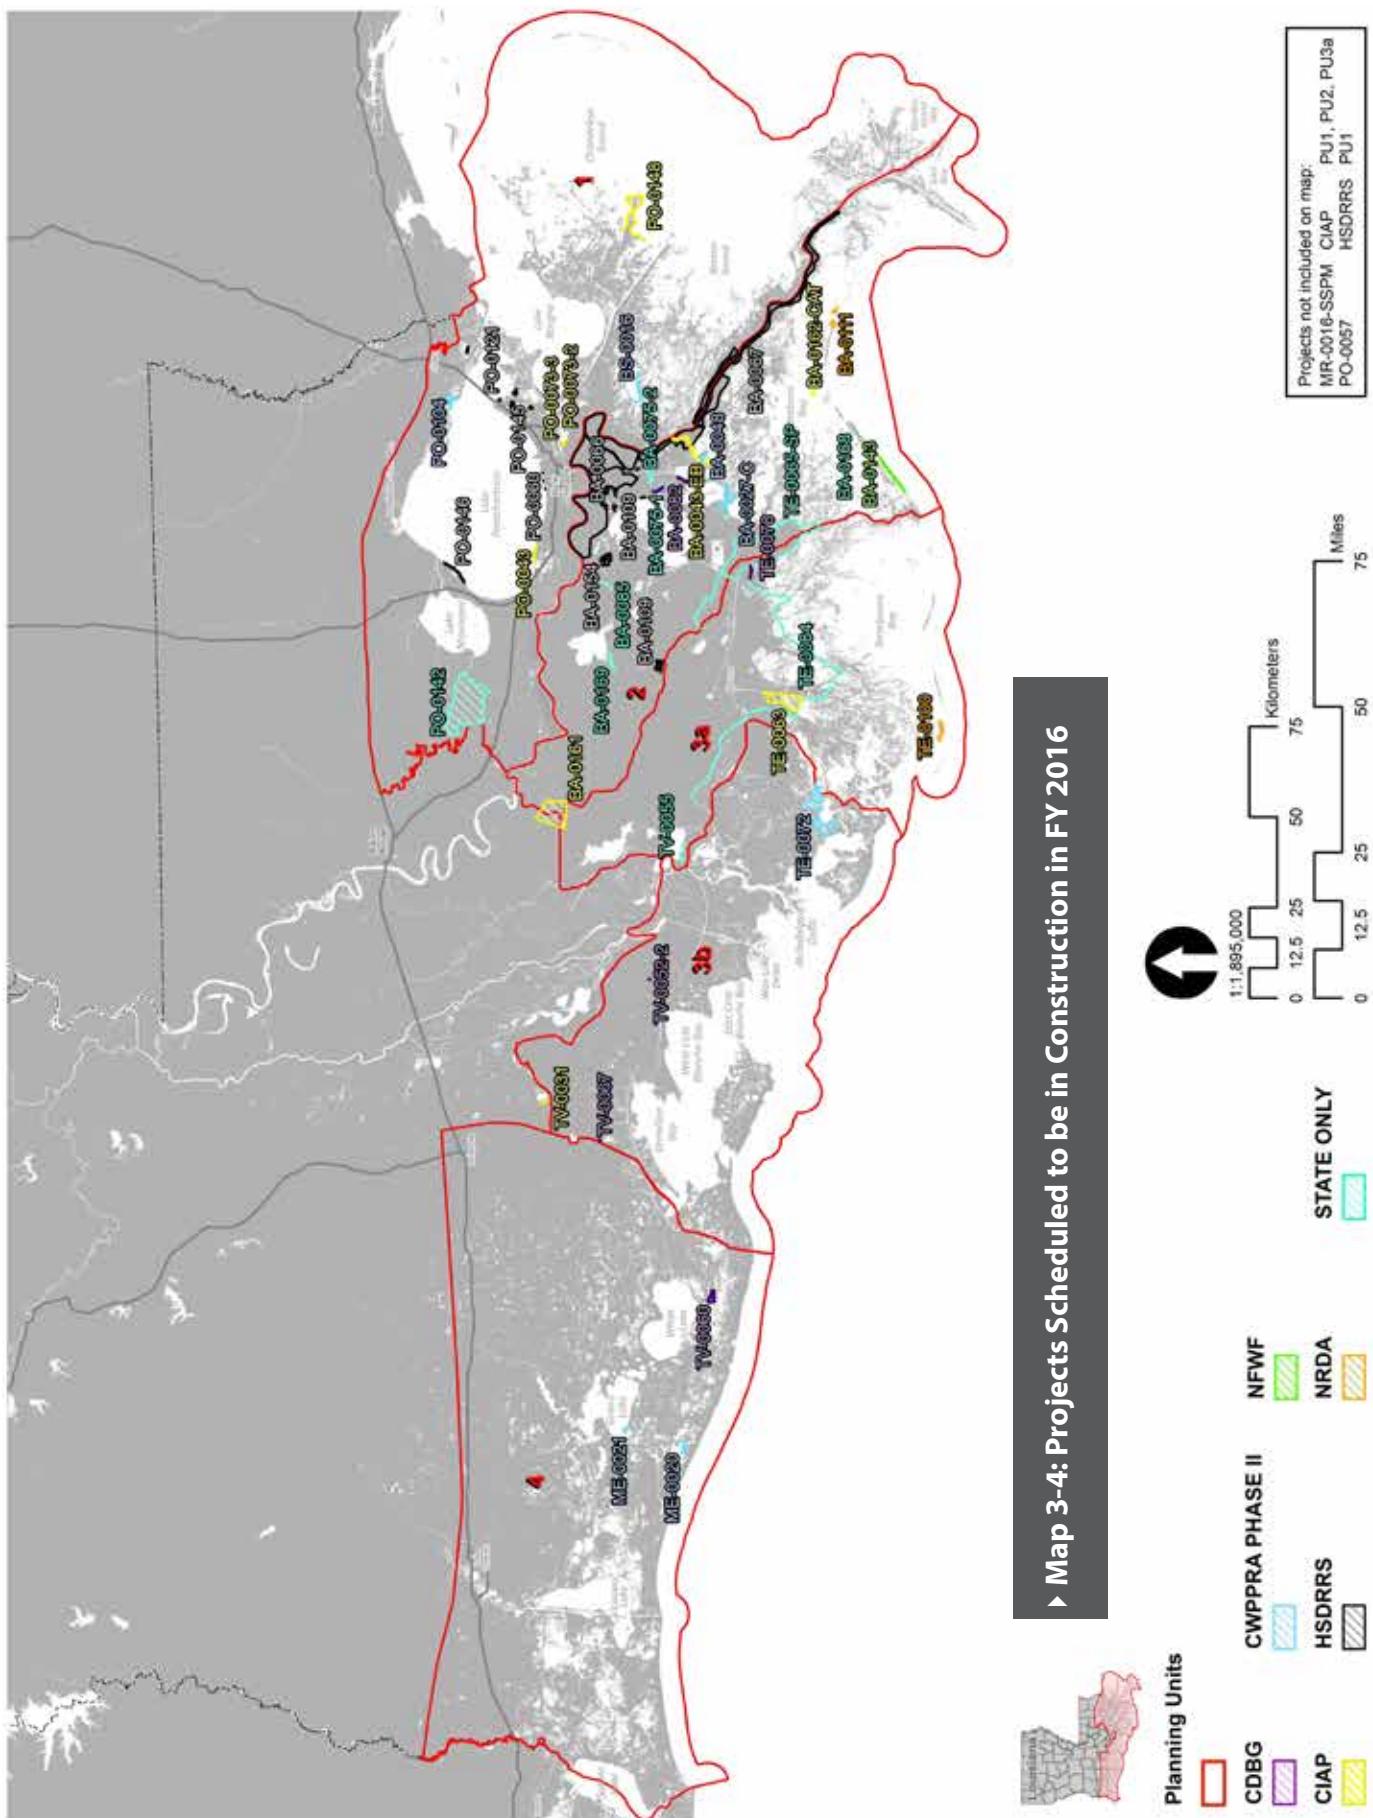

► Table 3-1: Projects Scheduled to be in Construction in FY 2016

Project ID	Project Name	Construction Start Date ¹	Construction Finish Date	State Construction Budget
CWPPRA Phase II Projects				
BA-0027C	Barataria Basin Landbridge Shoreline Protection, Phase 3-CU7 & 8	21-Jan-15	09-Jun-16	\$3,765,298
BA-0048	Bayou Dupont Marsh and Ridge Creation Project	11-Jun-13	04-Jan-16	\$5,343,343
BS-0016	South Lake Lery Shoreline and Marsh Restoration	05-Sep-13	02-Jun-16	\$4,470,149
ME-0020	South Grand Chenier Marsh Creation Project	15-Jun-15	11-Aug-16	\$3,039,739
ME-0021	Grand Lake Shoreline Protection - Tebo Point	02-Jul-15	01-Apr-16	\$1,350,988
PO-0104	Bayou Bonfouca Marsh Creation	07-Dec-15	01-Dec-16	\$3,818,511

A photograph showing a large, weathered metal pipe lying on a sandy, uneven surface. In the background, there are large mounds of dark, granular material, likely salt or coal. Further back, a industrial facility with several buildings and structures is visible across a body of water under a blue sky with scattered clouds.

Section 4

Projections: 2016 - 2017 - 2018

Congratulations to the High School Division winners of the CPRA and Youth Wetlands Program's inaugural Student Poetry Contest.

"Laissez Les Bon Temps Rouler"

1st Place

"Let the good times roll"
It's the motto of my Louisiana people,
It helps us to remember
A different time, a different place, or a different person
But for me...
I think of the Louisiana coast
I think of the old camps on the water
The fishing with family
The birds soaring across the bayous
The crawfish boils
I think of every moment of joy
And then the hurricanes
I think of every moment of sadness
Like those hurricanes that chip away at our coast
But not the people
Those hurricanes have never taken away the joy of the
people of Louisiana
Those windy disasters brought us even closer to finding a
way
To finding a way to save our wetlands
And slowly, very patiently
We will find a way to solve this problem
So that the people of Louisiana can once again say,
"Laissez les bon temps rouler."

*By: Meredith Perniciaro, Age 15
St. Rose, La.*

"Ourselves"

2nd Place

Louisiana, home of Jazz, Mardi Gras, and the Big Easy
Yet the most ignored thing is the coast of our state
If it is ignored there will be no Big Easy
Just ignorance
Blinded by profit
Blinded by greed
Sweet hot southern sun
Beaming down on the coast
Shelter, refuge, and concealment
Mother to our culture
Our home
This is my Louisiana

*By: Gilberto Sotres, Age 16
Harvey, La.*

"Coastal Paradise"

3rd Place

A swaying sea of brown and green
Filled with life often unseen
Majestic home to valuable life
An innocent victim of nature and human strife

Clothed in silence and mysterious grace
Where birth and death interlace
A blue heron sings its ancient song

Tupelo cypress bend their weathered knees
Peering from dark and murky seas
A water-logged wilderness
Dressed to impress

Bright dragons in blues and greens
Hunt their prey over primordial streams
Designed by our creator's hand
A fragile and essential land

Where bobcats, black bear, and nutria thrive
A paradise that must survive
Through it flows the land's life water
Slowly bleeding into the depth of sea

The pictures changes from hour to hour
As day draws to a close where the cypress tower
The creatures of the night begin their flight
As the Louisiana sun extinguishes her light

As this ancient land ends its day
Its hope is that human kind will allow it to stay
Set aside dreams of wealth
To protect this treasure renewed stealth.

St. Martinville, La.*

Section 4

Projections: Fiscal Years 2016 – 2017 – 2018

Table 4-1 presents projected state revenues over the next three fiscal years. Tables 4-2 through 4-4 show how the state proposes to spend its coastal budget over the next three fiscal years. Figures 4-1 through 4-3 depict projected expenditures by project phase for FY 2016–FY 2018, respectively.

While the three-year projections provide readers with an informative picture of the state's upcoming activities, the Legislature only reviews and approves expenditures for FY 2016 (July 1, 2015 through June 30, 2016). The implementation plan incorporates projects that have received funding for planning, design, construction, or OM&M. The state is exploring new funding sources, with the intent of obtaining this level of funding consistently from year to year so that new projects can continue to be brought on line. The state acknowledges that new project opportunities may arise as federal funds become available after the approval of the FY 2016 Annual Plan. In this event, any requests for additional expenditures will be submitted for approval by the CPRA Board.

Sources of Coastal Funding

The state will continue to pursue new possible funding sources while we make the most efficient use of existing funding sources, which include the following:

- The state Coastal Protection and Restoration Trust Fund is largely supported by mineral revenues and severance taxes on oil and gas production on state lands. The Trust Fund provides funding for the coastal program's ongoing operating expenses and for continuing state efforts in coastal restoration and protection.
- The USFWS Administrator of the CIAP program allocated approximately \$497 million in CIAP funds to Louisiana and its 19 coastal parishes over a four-year period, with the state receiving 65 percent. All state CIAP funds are expected to be expended by December 2016.
- The Louisiana Legislature allocated funds from state budget surpluses in 2007, 2008, and 2009 to the coastal program, providing a \$790 million investment in coastal protection and restoration efforts. All surplus funds are currently projected to be expended by FY 2018.
- The Gulf of Mexico Energy Security Act (GOMESA) provides four Gulf Coast states, including Louisiana, with 37.5 percent of Federal revenue gained from new OCS drilling leases. Full funding from GOMESA will begin in 2017 and is expected to eventually contribute \$100–200 million to Louisiana each year. No end date has been established for GOMESA funding. The state is considering bonding GOMESA funds based on expected revenue from future oil and gas royalty payments, a strategy that could contribute significant funding to the coastal program over the near-term. The state is also considering borrowing GOMESA funds from the federal government

based on expected future royalties. Before bonding or borrowing can take place, however, the U.S. Department of the Interior must publish regulations for allocating funds to the state, and the state must estimate the amount of money that can be expected from oil and gas revenues (both short- and long-term). With these estimates, the potential revenue stream can be evaluated.

- Louisiana received \$1.06 billion in CDBG funding to assist in the recovery from Hurricanes Gustav and Ike. This total includes an allocation of \$27.4 million for state coastal protection and restoration projects. All CDBG funding resulting from Hurricanes Gustav and Ike is currently projected to be expended by FY 2017.
- The Office of the Governor generates a Capital Outlay Budget Proposal with a list of projects to be granted cash and non-cash lines of credit. State and non-state entities may submit Capital Outlay requests for inclusion in the proposal. For FY 2016, the CPRA is requesting Capital Outlay funding to supplement implementation of 13 coastal projects. Additional information about this request is presented in Appendix F. Final decisions on Capital Outlay requests will be announced at the close of the 2015 Regular Legislative Session.

Development of Funding Projections

The budget projections in Tables 4-2 through 4-4 show the amount of state funds that would actually be needed to accomplish the proposed implementation plan for the next three fiscal years. When developing these projections, the planning team worked with the following assumptions:

- Projected Trust Fund revenues are based on the most recent available information; however, this revenue is difficult to estimate in advance because of a complicated formula and funding triggers based largely on fluctuating mineral revenues.
- All remaining funds earmarked for projects from 2007, 2008, and 2009 surplus funds were carried forward and are shown as revenue for the purposes of the FY 2016 Annual Plan.
- Funding projections represent known avenues through which funding will be received. However, many uncertainties persist regarding the percentages and amounts of funding to be provided by the federal government and local sponsors. Should more dollars become available, the state will be able to expand its efforts and allocate these funds under the direction of the CPRA Board.

Forecasting the Future Funding Picture

The Coastal Master Plan outlines projects for implementation over a 50-year planning horizon. To support this effort, the state is actively pursuing possible sources of funding that may be available over the next 50 years to support future coastal restoration and flood risk reduction projects. The *Deepwater Horizon* oil spill has the potential to be a significant source of funding in the coming years.

Flexibility to Respond to Changing Conditions

Revenue and expenditure projections in Tables 4-1 and 4-2 are based on the most recent available information. Tables 4-1 and 4-2 present a forecast based on a snapshot in time. However, as the *Deepwater Horizon* oil spill illustrates, the coastal program needs some degree of funding flexibility to enable the state to respond appropriately to changing conditions on the ground. The CPRA has been granted authority to reprogram dollars from approved funding streams and allocate the dollars to best meet new opportunities or needs. Reprogramming of existing and new funds will likely occur, with approval from the CPRA Board, to ensure that limited coastal program funds are allocated to the areas of greatest need and in a manner that will provide the greatest overall benefit to the coast. Such flexibility allows the coastal program to respond effectively to unforeseen events that take place outside the legislatively mandated planning cycle.

► Table 4-1: Projected Three-Year Revenues (FY 2016 - FY 2018)

Revenue Sources	FY 2016	FY 2017	FY 2018	Program Total (FY 2016 - FY 2018)
CPR Trust Fund Annual Revenue ¹	\$27,600,000	\$27,900,000	\$28,400,000	\$83,900,000
CPR Trust Fund Carried Forward	\$11,297,895	\$0	\$0	\$11,297,895

Project Billing	\$16,000,000	\$16,000,000	\$16,000,000	\$48,000,000
Capital Outlay Request Submitted for HSDRRS 30-Year Payback	\$0	\$93,149,239	\$93,149,239	\$186,298,478
Total Projected Revenue	\$773,426,169	\$486,144,216	\$461,638,805	\$1,721,209,190

Notes

1. Annually recurring revenue source.
2. Represents anticipated Federal reimbursement for CWPPRA projects led by CPRA in which the State is initially incurring more than its 15% cost share during project implementation.
3. NRDA funds have not been procured; projections represent possible FY 2015 - FY 2017 expenditures if funding is procured by June 30, 2014. NRDA project schedules are currently under development and may be refined at a later date; funds will be distributed according to final project schedules.
4. Supplemental funding to augment construction of eligible projects (specific projects to be determined at a later date).
5. Used to partially fund TV-0057.
6. Used to partially fund TV-0052-2.
7. Represents anticipated balance as of FY 2016 of an initial deposit of \$6.75 million of funds from the MOEX settlement.
8. Used to fund Coastal Community Resiliency Program.
9. Used to fund monitoring of constructed Berm to Barrier projects.
10. Represents anticipated Federal reimbursement for CWPPRA and WRDA OM&M activities led by CPRA in which the State is initially incurring more than its cost share during project implementation.
11. Represents anticipated reimbursement associated with recovery from past disasters which has been obligated by FEMA.
12. CPRA is pursuing FEMA recovery funding through the FEMA appeals process to restore the form and function of the Coastal Barrier Island Resource System (CBRS) units S01-S08 which were lost as a result of Hurricane Katrina. The cumulative cost of this restoration is estimated to be on the order of \$500 million.
13. Represents anticipated reimbursement of FEMA recovery funds through the FEMA appeals process to restore various beach and dune restoration projects damaged by Hurricane Isaac.
14. Represents reimbursement of expenditures for CPRA oil spill response activities.

► **Table 4-2: Projected Three-Year Expenditures¹ (FY 2016 - FY 2018)**

Revenue Sources	FY 2016	FY 2017	FY 2018	Program Total (FY 2016 - FY 2018)

Proposed RESTORE Expenditures (<i>not including surplus expenditures</i>)	\$22,654,397	\$24,483,191	\$78,474,156	\$125,611,744
LDNR Mitigation Expenditures ⁶	\$800,000	\$0	\$0	\$800,000
LDNR Beneficial Use Expenditures ⁶	\$500,000	\$0	\$0	\$500,000
Iberia Parish IGA Expenditures ⁷	\$380,000	\$0	\$0	\$380,000
St. Mary Levee District Expenditures ⁸	\$875,000	\$0	\$0	\$875,000
OM&M - State Expenditures (<i>not including surplus or CIAP expenditures</i>)	\$6,281,547	\$7,701,707	\$6,763,682	\$20,746,936
OM&M - Federal Expenditures ⁹	\$36,354,917	\$29,755,479	\$17,211,610	\$83,322,005
OM&M - Marine Debris Removal (<i>partially reimbursed by FEMA</i>) ¹⁰	\$1,640,130	\$0	\$0	\$1,640,130
OM&M - Isaac Beach and Dune Recovery (<i>partially reimbursed by FEMA</i>) ¹¹	\$45,823,644	\$45,823,644	\$0	\$91,647,288
Project Support	\$4,100,000	\$4,000,000	\$4,000,000	\$12,100,000
Operating Costs	\$37,625,874	\$45,994,647	\$49,761,799	\$133,382,320
Total Projected Expenditures	\$773,426,799	\$514,154,553	\$345,006,178	\$1,632,587,531

Notes

1. Represents proposed expenditures provided that commensurate level of funding is received.
2. Because CWPPRA projects compete for funding annually, CWPPRA expenditures as presented in Appendix B (which include projected expenditures for approved projects only) do not adequately capture likely CWPPRA expenditures in outlying years. The State's estimated CWPPRA expenditures for FY 2017 - FY 2018 are therefore based on prior years' expenditures.
3. Represents anticipated Federal reimbursement for CWPPRA projects led by CPRA in which the State is initially incurring more than its 15% cost share during project implementation.
4. Payback is based on current HSDRRS construction schedule; payback will not commence until completion of HSDRRS construction activities and consequently payback schedule may be revised at a later date.
5. NRDA funds have not been procured; projections represent possible FY 2015 - FY 2017 expenditures if funding is procured by June 30, 2014. NRDA project schedules are currently under development and may be refined at a later date; funds will be distributed according to final project schedules.
6. Supplemental funding to augment construction of eligible projects (specific projects to be determined at a later date).
7. Used to partially fund TV-0057.
8. Used to partially fund TV-0052-2.
9. Represents anticipated Federal reimbursement for CWPPRA and WRDA OM&M activities led by CPRA in which the State is initially incurring more than its cost share during project implementation.
10. Represents anticipated reimbursement associated with recovery from past disasters which has been obligated by FEMA.
11. Represents anticipated reimbursement of FEMA recovery funds through the FEMA appeals process to restore various beach and dune restoration projects damaged by Hurricane Isaac.

► Table 4-3: Programmatic Projected Three-Year Expenditures (FY 2016 - FY 2018)

Program	FY 2016	FY 2017	FY 2018	Program Total (FY 2016 - FY 2018)
Ongoing Program Expenditures				
Beneficial Use Program ¹	\$4,000,000	\$2,000,000	\$2,000,000	\$8,000,000

Notes				
1. FY 2016 expenditures fully funded by surplus funds.				
2. FY 2016 expenditures partially funded by surplus funds.				
3. FY 2016 expenditures funded by NFWF Adaptive Management Funds.				

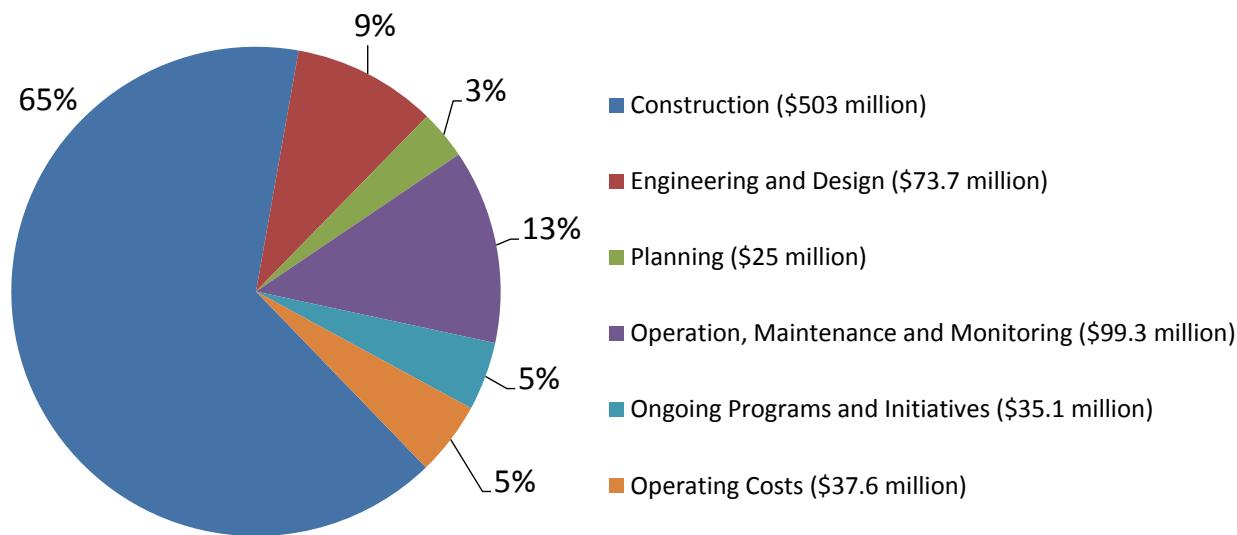

► **Table 4-4: State Protection and Restoration Projected Three-Year Operating Expenditures (FY 2016 - FY 2018)**

Program	FY 2016	FY 2017	FY 2018	Program Total (FY 2016 - FY 2018)
CPRA	\$23,529,106	\$23,529,106	\$23,529,106	\$70,587,318
OCM ¹	\$2,902,134	\$2,902,134	\$2,902,134	\$8,706,402
Office of the Governor - Coastal Activities	\$1,397,730	\$1,397,730	\$1,397,730	\$4,193,190
DNR Secretary	\$1,649,000	\$1,649,000	\$1,649,000	\$4,947,000
Office of the Attorney General	\$185,000	\$185,000	\$185,000	\$555,000
Department of Administration (<i>Fiscal shortfall 5% of Capital</i>)	\$2,200,000	\$0	\$0	\$2,200,000
Total Operating Costs	\$31,862,970	\$29,662,970	\$29,662,970	\$91,188,910

Notes

1. Includes \$75,000 per fiscal year for support of the Louisiana Department of Wildlife and Fisheries.

► **Figure 4-1: Projected FY 2016 Expenditures by Project Phase**

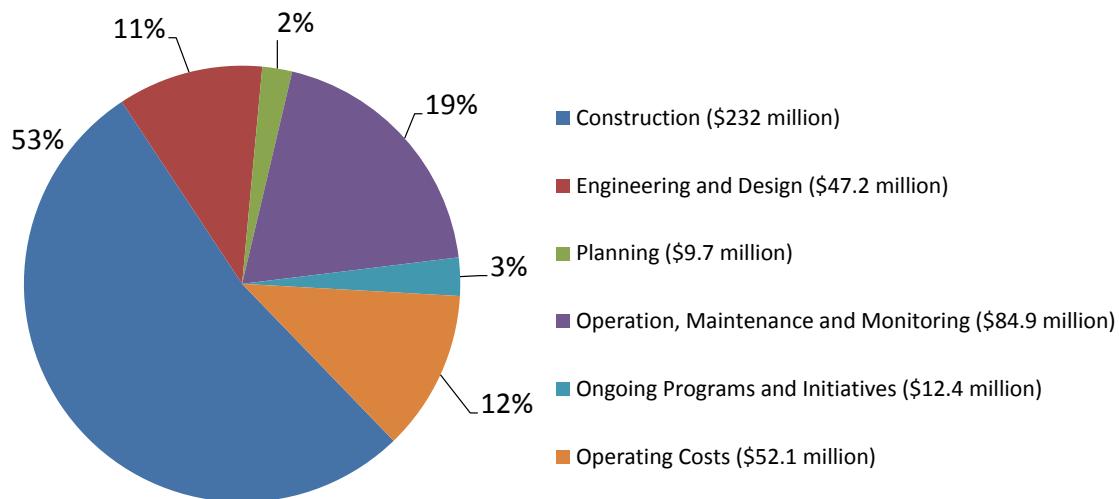

Notes

- Construction includes Beneficial Use (\$4 million)
- OM&M includes BIMP (\$361,000), Repair/Rehabilitation of Projects (\$1.1 million), Marine Debris Removal (\$1.6 million), and Isaac Beach and Dune Recovery (\$45.8 million).
- Ongoing Programs Includes Project Support (\$4.1 million)

**TOTAL Expenditures
\$773 million**

► **Figure 4-2: Projected FY 2017 Expenditures by Project Phase**

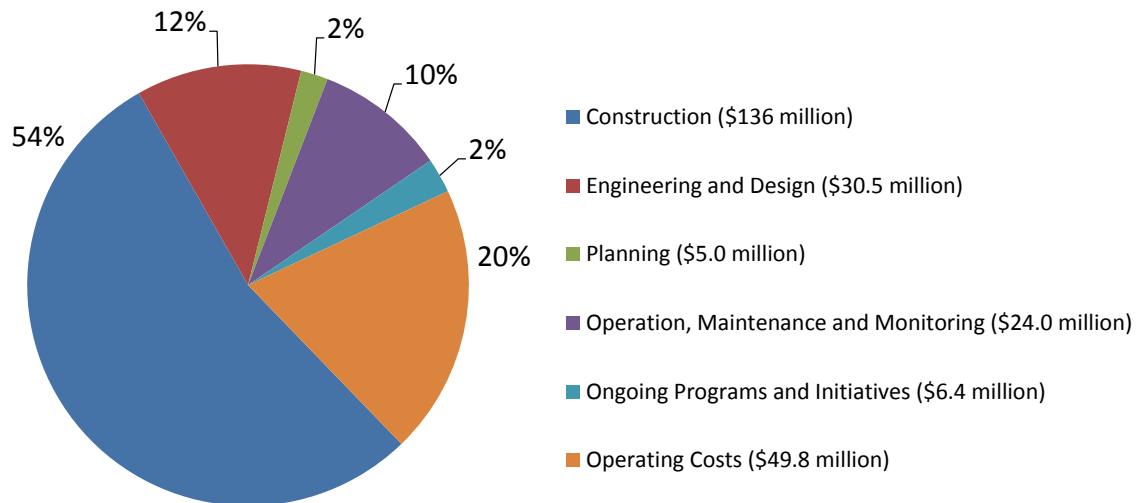

Notes

- Construction includes Beneficial Use (\$2 million)
- Engineering and Design and Construction include CWPPRA adjustment for outlying years (see Table 4-2 for explanation)
- OM&M includes Isaac Beach and Dune Recovery (\$45.8 million)
- Ongoing Programs includes Project Support (\$4 million)
- Total excludes HSDRRS Payback (\$93.1 million)

**TOTAL Expenditures
\$421 million**

► **Figure 4-3: Projected FY 2018 Expenditures by Project Phase**

Notes

- Construction includes Beneficial Use (\$2 million)
- Engineering and Design and Construction include CWPPRA adjustment for outlying years (see Table 4-2 for explanation)
- Ongoing Programs includes Project Support (\$4 million)
- Total excludes HSDRRS Payback (\$93.1 million)

**TOTAL Expenditures
\$252 million**

Ongoing Protection and Restoration Project Summaries

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Levee Improved	Construction Completion	Total Budget	Project Description	Planning Unit
BERM	Riverton Sand Mining/Scofield Shell Island Restoration	BA-40	BH	N/A	PLAQUEMINES	606	N/A	2013	\$60,839,484	The goal of this project is to transport sediments from the Mississippi River to restore dune and marsh habitat on Scofield Island. Project was designed under CWP/PRRA, but constructed using Berms to Barrier funds.	2
BERM	Emergency Barrier Berms	BA-110	BH	N/A	PLAQUEMINES	626	N/A	2014	\$47,679,380	The purpose of the project is to restore the integrity of Shell Island East and a total fill area of 1,286 acres. A total fill area of 1,286 acres, habitat to Basin Bay and the surrounding area. Shell Island East was constructed to a length of approximately 8 miles, a dune elevation of +80 feet NAVD88, a marsh elevation of +2.5 feet NAVD88, and a total fill area of 1,286 acres.	2
BERM	Emergency Barrier Berms	N/A	OT	N/A	PLAQUEMINES, SAINT BERNARD	1417	N/A	2011	\$251,000,000	In response to the Deepwater Horizon oil spill of 2010, the State of Louisiana constructed approximately 16 miles of sand berms along several sections of the State's barrier islands both east and west of the Mississippi River. The objective of this project was to provide a barrier to oil and minimize the potential impact of oil spill to thousands of acres of fragile barrier islands and wetlands in coastal Louisiana. Approximately 16 miles of barrier berm were constructed along existing and relic barrier islands in the Chandeleur Islands (Reach E4, 4,000 LF), Shell Island (Reach W4, 9,000 LF), and Scofield Island (Reach W10, 7,000 LF). Sediment placed in Reaches W4, W9, and W10 was subsequently utilized in barrier island restoration projects BA-10, BA-38, and BA-40, respectively.	1, 2
CDBG	Lafitte Area Levee Repair	BA-82	HP	HUD	JEFFERSON	N/A	4	Pending	\$600,000	This project will repair damages to the existing levees in the Fisher Basin Area. This damage was caused by heavy equipment and vehicles used on the levee for flood fighting activities during Hurricane Gustav. This project will provide for a 4 inch lift on approximately a 5 mile stretch of levee.	2
CDBG	Rosemont Wetland Assimilation Project	BA-83	HR	HUD	JEFFERSON	334	N/A	Pending	\$1,093,769	The Rosemont Treatment facility currently discharges treated municipal effluent into Bayou Barataria. This project will utilize secondary treated municipal effluent diverted from the Rosemont Treatment facility, to restore and sustain coastal wetland habitats.	2
CDBG	Bayou Lafourche Fresh Water Memorial Pump Station Renovations	BA-84	FD	HUD	ASCENSION	N/A	N/A	Pending	\$3,194,355	This project will replace two of the existing pumps and motors at the Walter S. Lehmann Pump Station. This project will also install an emergency generator to operate the pump station during power outages.	2, 3A
CDBG	Madisonville Bulkhead	PO-87	SP	HUD	ST TAMMANY	N/A	C.1	Pending	\$2,144,266	This project will provide construction of improvements to the existing bulkhead along the shore of Lake Ponchartrain and the Tchelatchie River at the Madisonville Marina.	1
CDBG	St. Tammany Parish Watershed Management Study	PO-151	HR	HUD	ST TAMMANY	N/A	N/A	N/A	\$1,363,233	This project involves a planning study to evaluate the feasibility of watershed management measures in St. Tammany Parish.	1
CDBG	Cut-Off Pointe Aux Chene Levee	TE-78	HP	HUD	LAFOURCHE	N/A	8	Pending	\$8,488,857	This project will fill in the missing gap that is currently in the existing levee system. The 2.5-mile levee will be constructed along Grand Bayou and tie into the existing levee systems on each end.	3A
CDBG	Franklin Floodgate Sinkable Barge and Pump Station (Phase 1)	TV-52-1	HP	HUD	ST MARY	N/A	C.2	2012	\$4,591,380	This project involves the construction of a sinkable barge structure on Franklin Canal to prevent storm surge from inundating the town of Franklin.	3B
CDBG	Franklin Floodgate Sinkable Barge and Pump Station (Phase 2)	TV-52-2	HP	HUD	ST MARY	N/A	C.2	Pending	\$2,148,866	This project will construct a pump station adjacent to the sinkable barge structure on Franklin Canal (constructed in Phase 1 of the project) to prevent storm surge from inundating the town of Franklin.	3B
CDBG	Flood Control Structure at Boston Canal (Deauthorized)	TV-58	HP	HUD	VERMILION	N/A	N/A	Deauthorized	\$5,800,000	This project involves a flood control structure at the intersection of Boston Canal and the GIWW, which could be closed in the event of a hurricane or tropical storm. Intersection of Boston Canal and the GIWW, that could be closed in the event of a hurricane or tropical storm.	3B
CDBG	Front Ridge Chennier Teranea Protection	TV-60	TE	HUD	VERMILION	40	N/A	Pending	\$2,078,162	This project will construct approximately 85,000 linear feet of marsh levees south east of Pecan Island in Vermilion Parish.	4
CDBG	Bayou Igne Flood Control Project	TV-67	HP	HUD	VERMILION	N/A	0.1	Pending	\$6,343,862	This project involves the implementation of flood control measures in Bayou Igne.	4
CIAP	Morgan City Industrial Road	AT-05	OT	USFWS	ST MARY	N/A	N/A	Pending	\$1,247,000	The project is a road alignment that begins at the First Street floodgate in Morgan City, LA. The alignment will proceed along the unpopulated side of the industrial distance of 1,657 feet. And at the Port of Morgan City's north gate. The project goal is to reduce the truck traffic through the residential neighborhoods by rerouting the traffic through the proposed new road, and decrease the traffic in the residential area.	3B
CIAP	Atchafalaya Long Distance Sediment Pipeline	AT-15	OT, MC	USFWS	TERREBONNE	N/A	N/A	N/A	\$1,500,000	This project involves the establishment of approximately 300 acres of critical areas of fragile marsh in lower Terrebonne Parish. The project benefit is to provide more road access to the industrial facilities and the museum through the proposed new road, and decrease the traffic in the residential area.	3A
CIAP	Lake Salvador Shoreline Protection (Phase II)	BA-15X-2 (EB)	SP	USFWS	ST CHARLES	844	N/A	2009	\$2,300,000	This project involved the construction of approximately 7,000 linear feet of shoreline protection near the northwest shore of Lake Salvador.	2
CIAP	East Grand Terre	BA-30 (EB)	BH	USFWS	PLAQUEMINES	683	N/A	2010	\$25,426,247	The project goal is to restore 2.8 miles and 620 acres of marsh by dredging 3.3 million cubic yards of offshore material and rebuilding the island. The project was designed under the CWP/PRRA Program and constructed under the CIAP program.	2
CIAP	Barataria Land Bridge Dedicated Dredging (CIAP)	BA-36 (EB)	MC	USFWS	JEFFERSON	363	N/A	2010	\$8,000,000	The objective of this project is to create and/or nourish 720 acres of marsh in conjunction with CWP/PRRA project BA-36.	2
CIAP	Long Distance Mississippi River Sediment Pipeline	BA-43 (EB)	OT, MC	USFWS	LAFOURCHE, JEFFERSON,	371	N/A	Pending	\$6,094,075	The goal of this project is to use material dredged from the Mississippi River and transported via new permanent pipeline across the Barataria Basin to create marsh and/or a ridge.	2
CIAP	Caminada Headlands	BA-45	BH	USFWS	LAFOURCHE	730	N/A	Pending	\$70,679,380	The proposed project will restore and protect beach and dune habitat across the Caminada Headland through the direct placement of sediment (sandy) material to the beach and dune habitat (from offshore borrow areas).	2
CIAP	LA 1 Improvements - Fourchon to Leveille Bridge (CIAP)	BA-55	OT	USFWS	LAFOURCHE	N/A	N/A	2010	\$33,000,000	This project is located 60 miles south of New Orleans in lower Lafourche Parish between Leveille and Port Fourchon. The project connects the Phases A, B and Phase IC projects (Leveille) with a construction of a 5 mile long, 12 lane elevated highway (no. 12 lanes and two 8 ft shoulders). The Phase A, project helps minimize the confined fragmentation of wetlands system throughout the coast.	2
CIAP	Fringe Marsh Repair	BA-58	MC	USFWS	PLAQUEMINES	300	N/A	2014	\$8,756,605	This project involves the construction of a series of submerged wave breaks surrounding the Cat Islands in order to protect the oil damaged shores along the existing island remnants from further wave damage while also collecting sediment in order to naturally rebuild the degraded infrastructure of the islands.	2
CIAP	Mississippi River Water Reinjection into Bayou Lafourche - BLFWD	BA-161	FD	USFWS	ASSUMPTION, LAFOURCHE	No Available	N/A	Pending	\$20,000,000	This project consists of the establishment of approximately 300 acres of critical areas of fragile marsh in lower Terrebonne Parish. Overall project features identified to allow for the continued dredging of a 1,000 cfs channel for an additional 7.12 miles of Bayou Lafourche. Modification of wet structures, bank stabilization along Bayou Lafourche, monitoring stations, and dredging of Bayou Lafourche, increasing the flow down Bayou Lafourche by 1,000 cfs has been modeled to benefit approx. 120,000+ 130,000 acres in the distribution of sediment and nutrients from the river.	2, 3A
CIAP	Shoreline Protection Cat Island	BA-162-CAT	SP	USFWS	PLAQUEMINES	40	N/A	Pending/On Hold	\$1,200,000	This project will consist of a series of submerged wave breaks surrounding the existing remnants of the Cat Islands in order to protect the oil damaged shores along the existing island remnants from further wave damage while also collecting sediment in order to naturally rebuild the degraded infrastructure of the islands.	2
CIAP	Shoreline Protection Emergency Restoration	BA-162-SPER	SP	USFWS	PLAQUEMINES	40	N/A	2013	\$355,280	The project consists of a series of submerged wave breaks surrounding shoreline segments in lower Terrebonne Parish to protect the oil damaged shores along the existing island remnants from further wave damage while also collecting sediment in order to naturally rebuild the degraded infrastructure of the islands.	2
CIAP	Bayou Lamouche Floodgate Removal (Inactive)	BS-13 (EB)	FD	USFWS	PLAQUEMINES	660	N/A	Inactive	\$2,070,055	This project involves the removal of floodgates through the water control structures.	1
CIAP	FFF Island Restoration	CIAPII	SP	USFWS	JEFFERSON	126	N/A	2003	\$751,406	This project provides protection for approximately 100 acres of existing island habitat (Grand Isle & Fifi Island) by the installation of approximately 10,000 linear feet of rock shore protection. An additional \$989,500 was contributed from the CIAP of 2001 for the construction and design of this project.	2
CIAP	Marsh Creation via Beaufiful Use (Phase 1 (Black Lake))	CS-35 (EB)	DW	USFWS	CAMERON	300	N/A	2010	\$10,000,000	This project involves construction of an overbank on Trosclair Road, a parish road that is heavily used by offield traffic. The project is approximately 8 miles long and connects State Highway 27/82 from Cameron to State Highway 62 to Oak Grove.	4
CIAP	Trosclair Road Repairs	CS-47	OT	USFWS	CAMERON	N/A	N/A	2009	\$2,039,692	This project involves construction of an overbank on Trosclair Road, a parish road that is heavily used by offield traffic. The project is approximately 8 miles long and connects State Highway 27/82 from Cameron to State Highway 62 to Oak Grove.	4

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Levee Improved	Construction Completion	Total Budget	Project Description		Planning Unit
CIAP	Bush Canal and Bayou Terebonne Bank Stabilization	DNR 2513-0311	SP	USFWS	TERREBONNE	4300	N/A	2007	\$37,000,000	This project reconstructed the south bank of Bush Canal using material dredged from the canal. The restored bankline was then covered with geotextile fabric and armored with stone rip-rap. The rebuilt bankline will help to diminish storm surge as well as reduce saltwater intrusion. This project was funded by the CIAP of 2001.	3A	
CIAP	Performance Evaluation - Barataria Land Bridge Biological Monitoring	LA-12-2	OT	USFWS	JEFFERSON	N/A	N/A	N/A	\$42,618,000	This research study will be conducted on the Barataria Land Bridge Dedicated Dredging Project (BA-36) and will assess the effect of dredged sediment application on soil-vegetation-hydrologic dynamics within deteriorating interior brickish marshes.	2	
CIAP	Performance Evaluation - Freshwater Bayou	LA-12-3	OT	USFWS	VERMILION	N/A	N/A	N/A	\$286,028	This study focuses on the expected vertical elevation change of the dredge slurry fill due to immediate and long term settlement and consolidation. Work performed: reviewing previous analyses performed to help predict stability to predict settlement and consolidation. Additionally, field samples and construction monitoring shall be performed to verify the accuracy of the settlement and consolidation analyses performed during Project design.	3A	
CIAP	CIAP Performance Evaluation - Barataria Basin Studies	LA-12-5	OT	USFWS	JEFFERSON LAFOURCHE	N/A	N/A	N/A	\$558,600	Evaluation of Tidal Pass Monitoring Project at East Grand Terre and Development of Barataria Island Comprehensive Monitoring Program vegetation sampling protocols.	2	
CIAP	CIAP Performance Evaluation - Caminada Marsh Subsidence Study	LA-12-6	OT	USFWS	JEFFERSON LAFOURCHE	N/A	N/A	N/A	\$813,512	Research to be conducted on the Caminada Headland in order to quantify the amount of consolidation in the substrate underlying barrier Islands resulting from placement of sand or island restoration.	2	
CIAP	CIAP Performance Evaluation - Borrow Area Management and Monitoring	LA-12-7	OT	USFWS	COASTWIDE	N/A	N/A	N/A	\$20,166,136	A program to preserve existing coastal forest via purchase of fee title or conservation servitudes from willing land owners. The study involves the collection of geophysical, geological and water quality data from several borrow areas to understand not only the above objectives but also the hydroic conditions vis-a-vis depth of cut of borrow areas.	COASTWIDE	
CIAP	Coastal Forest Conservation Initiative	LA-13	PP, OT	USFWS	COASTWIDE	40000	N/A	2009	\$8,500,000	The Borrow Area Monitoring and Management (BAMM) was initiated to understand the evolution of borrow pits for restoration projects (inshore, nearshore, and offshore) over time, with a particular focus on the milling (rates and types of sediment) and gradient of the pit slopes as well as potential dredge impacts. The study involves the collection of geophysical, geological and water quality data from several borrow areas to understand not only the above objectives but also the hydroic conditions vis-a-vis depth of cut of borrow areas.	COASTWIDE	
CIAP	Rockefeller Shoreline Protection Demo (CIAP)	ME-18 (EB)	SP	USFWS	CAMERON	23	N/A	N/A	\$1,170,982	A program to preserve existing coastal forest via purchase of fee title or conservation servitudes from willing land owners. The study involves the construction of three types of shoreline protection structures as a demonstration to determine which type(s) of structures are successful in protecting the shoreline. Successful structures are intended for use in a larger CIWPRA Project.	4	
CIAP	Grand Lake Shoreline Protection (CIAP)	ME-21 (EB)	SP	USFWS	CAMERON	495	N/A	2010	\$9,129,819	This project involves the construction of approximately 37,800 linear feet of shoreline protection on the south shore of Grand Lake from Superior Canal to Ieho Point.	4	
CIAP	Mississippi River Delta Strategic Planning - SSPM Expansion	MR-16-SSPM	OT	USFWS	EAST BATON ROUGE	N/A	N/A	Pending	\$13,520,000	This project involves the construction of a new expanded Small Scale Physical Model (SSPM) capable of modeling smaller flows and with an increased area of coverage in comparison to the previous SSPM. The project will also include the construction of a new facility to house the model as well as facilitate the use of the model for public outreach the educational efforts. The project will be valuable educational and research tool to providing insight and qualitative understanding of critical aspects of the impacts of major diversions of water and sediments, future conditions, and navigation impacts.	1, 2, 3A	
CIAP	Living Shoreline	PO-148	SP	USFWS	ST BERNARD, ORLEANS	5340	N/A	Pending	\$26,500,000	The primary project involves the construction of bioreinforced oyster reefs along coastal fringes marsh in St. Bernard Parish. The installation will take place from Ioh Point to the mouth of Bayou La Courte around Lydia Point and Paulina Point extending around the southern shore of treasure Bay. Other related living Shoreline projects are in Plaquemines Parish and Jefferson Parish.	1, 2	
CIAP	Violet Diversion	PO-35 (EB)	FD	USFWS	ST BERNARD	13200	N/A	N/A	\$1,170,982	This project investigates the diversion of freshwater from the Mississippi River into Lake Borgne to freshen Mississippi Sound, Central Wetlands, and Blox Marsh areas. The Feasibility Study for this project is being done as part of the MRGO Ecosystem Restoration FS.	1	
CIAP	Oceans Land Bridge SP & Marsh Creation	PO-36 (EB)	SP	USFWS	ORLEANS	140	N/A	2013	\$20,860,000	This project provides shoreline protection on the northwest rim of Lake Borgne west of Alligator Point.	1	
CIAP	East Lafourche Shoreline Protection	PO-43	SP	USFWS	ST CHARLES	Not Available	N/A	Pending	\$3,753,816	Through various funding mechanisms, including CIWPRA and CIAP, all but approximately 18,000 linear feet of the East Lafourche shoreline has been protected. Saint Charles Parish has acquired \$1,753,816 of CIAP funding to construct a 1400 linear feet of shoreline protection on PC-43 East Lafourche Shoreline Protection. The project has contributed additional \$20,000 in CIAP funding to construct Superior Canal to Ieho Point.	1	
CIAP	Central Wetlands Demonstration	PO-73	HR	USFWS	ST BERNARD	1020	N/A	Pending	\$3,500,000	This project involves the construction of a new expanded Small Scale Physical Model (SSPM) capable of modeling smaller flows and with an increased area of coverage in comparison to the previous SSPM. The project will also include the construction of a new facility to house the model as well as facilitate the use of the model for public outreach the educational efforts. The project will be valuable educational and research tool to providing insight and qualitative understanding of critical aspects of the impacts of major diversions of water and sediments, future conditions, and navigation impacts.	1	
CIAP	Central Wetlands - EBSTP to A2	PO-73-1	HR	USFWS	ST BERNARD, ORLEANS	346	N/A	Pending	\$2,000,000	This project involves the discharge of effluent from a CIWNO oxidation plant to be discharged into the Central Wetlands. This would allow regulation of water levels to gain in the area, and would also save St. Bernard Parish the cost of running a sewer line from the Oxidation Plant to the Munster Plant.	1	
CIAP	Central Wetlands Demonstration	PO-73-2	HR	USFWS	ST BERNARD, ORLEANS	473	N/A	Pending	\$4,500,000	This project involves the introduction of freshwater from the SWBNO's East Bank Sewer Treatment Plant to combat salt water intrusion from MRGO and thus attempt to repopulate the once thriving Central Wetlands. The project involves piping treated effluent from the EBSTP to St. Bernard Parish and vegetative plantings to flourish and sustain marsh.	1	
CIAP	Rainey Audubon Wildlife Sanctuary Earth Terraces	PO-73-3	HR	USFWS	ORLEANS	172	N/A	Pending	\$4,500,000	The Central Wetlands Demonstration Expansion project would restore up to 77 acres of critical wetlands in the area designated A-1 using wetlands assimilation of treated wastewater effluent and/or beneficial use of ashlards from the East Bank Wastewater Treatment Plant, other sediment from SWBNO operations. Once the cell has been completed, the intent is to promote an ecological habitat for indigenous plantings from cypress up trees to floating marsh islands. Marsh islands shall encourage the development of open water areas and pling the spoil on one side of the borrow area. An additional \$321,763 was contributed from the GAP of 2001.	1	
CIAP	GWY Bank Restoration of Critical Areas of Terrebonne (CIAP)	RAINNEY	MC	USFWS	VERMILION	640	N/A	2005	\$951,661	The project objective is to restore critical lengths of deteriorated channel banks and stabilize or selected critical lengths of deteriorated channel banks with hard shoreline stabilization materials.	3B	
CIAP	Freshwater Bayou Bank Stabilization	TE-43 (EB)	SP	USFWS	TERREBONNE	1,180	N/A	2011	\$7,274,676	The project objective is to restore critical lengths of deteriorated channel banks and the large equipment used in transporting these products takes a major toll on the port's bridges and roadways.	3B	
CIAP	Faigout Canal Freshwater Enhancement	TE-63	FD	USFWS	TERREBONNE	5000	N/A	Pending	\$9,551,074	This project involves construction/modification of a mile structure at a site located on the HIC near Faigout Canal, modeling of the basin, along with channel improvements, as necessary, to improve efficiency of freshwater flow within the basin area. In addition, the project involves patching and overlaying 35,000 linear feet of terraces. The terraces were created by dredging in shallow open water areas and pling the spoil on one side of the borrow area. An additional \$321,763 was contributed from the GAP of 2001.	3A	
CIAP	Port of Iberia Bridge - Port Road over Commercial Canal	TV-28	OT	USFWS	IEIRIA	N/A	N/A	2013	\$62,579,212	This project involves the replacement of the bridge on Port Road over Commercial Canal at the Port of Iberia. The project provides improved access to both the port and the town of Iberia.	3B	
CIAP	Port of Iberia Bridge Replacement - David Dubois Road over Commercial Canal	TV-30	OT	USFWS	IEIRIA	N/A	N/A	2013	\$1,058,013	This project involves the replacement of the bridge on David Dubois Road over Commercial Canal at the Port of Iberia. The Port of Iberia handles a substantial amount of OCS produced products and the large equipment used in transporting these products takes a major toll on the port's bridges and roadways.	3B	
CIAP	Acadiana Regional Airport Street Improvements - Drove Drive	TV-31	OT	USFWS	IEIRIA	N/A	N/A	Pending	\$1,114,942	The project involves patching and overlaying 5,310 feet (about 1 mile) of Admiral Doyle Road around the Acadia Regional Airport in Iberia Parish from its intersection with LA 321 to the end of the four lane section. The project provides improved access to both the airport and the town of Iberia.	3B	
CMPPRA	Atchafalaya Sediment Delivery	AT-02	SD	NMFS	ST MARY	2232	N/A	1993	\$2,532,147	The objective of this project is to enhance natural delta growth by reopening Nataf Channel and Castle Pass. Nataf Channel was re-established with a 120-foot wide, 10-foot deep, 6.88-acre foot cubic yards as a result of construction was strategically placed at elevations mimicking natural delta slopes.	3B	
CMPPRA	Big Island Mining	AT-03	DM	NMFS	ST MARY	1560	N/A	1993	\$7,077,404	The project includes creating a new western delta behind Big Island to enhance the acreage of land beyond the west bank of the Atchafalaya River. Construction included dredging of a main stem and five branch channels designed to mimic natural channel bifurcations. Dredged material was strategically placed at elevations mimicking natural delta slopes. Re-opening the channels is allowing continued natural sediment transport and marsh growth.	3B	

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRAs Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Improved Levee	Construction Completion	Total Budget	Project Description	Planning Unit
CWPPIRA	Castille Pass Channel Sediment Delivery (Deauthorized)	AT-04	SD	NMFS	ST MARY	589	N/A	Deauthorized	\$1,717,883	This project investigates dredging a system of distributary channels to create 589 acres of marsh through sediment placement and natural drawdown.	3B
CWPPIRA	GIWW/Gulf Intracoastal Waterway to Clovelly Hydrologic Restoration	BA-02	HR	NRCS	LAFOURCHE	175	N/A	2000	\$12,896,358	The project includes the construction of features (including canal plugs, rock weirs, fixed crest weirs, fixed boat bays, one variable crest weir, and the rebuilding of low overflow banks that have eroded away) in eastern Lafourche Parish to restore the area to the hydrologic conditions that prevailed historically.	2
CWPPIRA	Naomi Outfall Management	BA-03C	OM	NRCS	JEFFERSON	634	N/A	2002	\$2,285,972	The project manages the outfall of the existing eight siphons by controlling the movement of the diverted waters. The siphons divert sediment-laden water from the Mississippi River into the west bank wetlands to retard saltwater intrusion and enhance wetland productivity.	2
CWPPIRA	West Pointe à la Hache Outfall Management	BA-04C	HR	NRCS	PLAQUEMINES	646	N/A	Pending	\$6,620,516	The project goal is to optimize use of fresh water and sediment supplied by existing siphon by reducing channelized flow and routing the diverted flow to natural marshes.	2
CWPPIRA	Lake Salvador Shore Protection Demonstration	BA-15	SP	NMFS	ST CHARLES	N/A	N/A	1993	\$5,856,506	The objective of this project is to maintain the shoreline along a section of Lake Salvador and help re-establish the natural hydrology of interior marsh. Phase I of the project was constructed to demonstrate the effectiveness of four separate types of segmented breakwaters in a poor soil environment. Phase II of the project included the installation of 8,000 feet of continuous rock structure along the western section of the lake.	2
CWPPIRA	Fourchon Hydrologic Restoration (Deauthorized)	BA-18	HR	LAFOURCHE	N/A	N/A	Deauthorized	\$7,703	The goal of this project was to restore tidal exchange to 2,400 acres of impounded wetlands. The project was officially deauthorized by the CWPPIRA Task Force on July 1994 at the request of the landowner.	2	
CWPPIRA	Barataria Bay Waterway Wetland Restoration (Deauthorized)	BA-19	MC	USACE	JEFFERSON	510	N/A	1996	\$1,170,000	The project beneficially used dredge material to enlarge Queen Bass Island.	2
CWPPIRA	Jonathan Davis Wetland Protection	BA-20	HR/SP	NRCS	JEFFERSON	510	N/A	2003, 2012	\$28,886,616	The goal of this project is to restore the natural hydrologic conditions of the area and reduce shoreline erosion. The goal was partly accomplished through constructing a series of water control structures. Construction unit 4 consists of 4,180 ft of rock rip rap revetment, 15,110 ft of concrete sheetpile wall plugs and marsh creation.	2
CWPPIRA	Bayou Perot/Bayou Rigolettes Marsh Restoration (Deauthorized)	BA-21	MC	NMFS	JEFFERSON	1065	N/A	Deauthorized	\$20,964	This project was authorized to protect deteriorated intermediate-to-brackish marsh located between Lake Salvador and Little Lake by using dredged material to re-establish the shoreline. Due to an unstable and rapidly eroding site, the project was deemed uneasible and was officially deauthorized by the CWPPIRA Task Force in January of 1986.	2
CWPPIRA	Bayou L'Orne/Ridge Hydrologic Restoration (Deauthorized)	BA-22	HR	NRCS	LAFOURCHE	737	N/A	Deauthorized	\$371,235	The project was proposed to restore natural hydrologic flow to the marsh by reinforcing breached areas of the Bayou L'Orne's Ridge through a series of canal closures and two water control structures. The project was officially deauthorized by the CWPPIRA Task Force in April 2003 because of funding issues.	2
CWPPIRA	Barataria Bay Waterway West Side Shoreline Protection (Deauthorized)	BA-23	SP	NRCS	JEFFERSON	1789	N/A	2000	\$3,013,365	The project objective is to stabilize the west bank of the Dupre Cut to protect the adjacent marsh from unnatural water exchange and subsequent erosion. A rock dike was constructed along 9,400 near feet of the west bank of the Barataria Bay Waterway.	2
CWPPIRA	Myrtle Grove Siphon (Deauthorized)	BA-24	FD	NMFS	PLAQUEMINES	N/A	N/A	Deauthorized	\$48,1803	The goal of the project is to reduce saltwater intrusion and to nourish existing marsh. This will be accomplished by diverting water through a siphon from the Mississippi River to adjacent wetlands. This project was officially deauthorized by the CWPPIRA Task Force in October 2007 because a larger diversion was authorized at the same location (see BA-33).	2
CWPPIRA	Bayou Lafourche Siphon (Deauthorized)	BA-25a	FD	EPA	LAFOURCHE	428	N/A	Deauthorized	\$45,922	The goal of this project is to reduce marsh loss adjacent to Bayou Lafourche by introducing new nutrient and sediment laden river water through large siphon pipes. This project was reauthorized on the 11th PPL as BA-25b.	2
CWPPIRA	Mississippi River Reinroduction Into Bayou Lafourche (Deauthorized)	BA-25b	FD	EPA	ASCENSION, ASSUMPTION, LAFOURCHE, TERREBONNE	85000	N/A	Deauthorized	\$9,619,586	The goal of this project is to restore and protect the health of marshes in the Barataria and Terrebonne basins through reintroduction of sediment and nutrient laden Mississippi River water via Bayou Lafourche. This project was originally authorized on the 5th PPL as BA-25. This project was officially deauthorized by the Bureau Act Task Force in October 2007; however, engineering and design will be continued by the CPERA using state funds.	2
CWPPIRA	Barataria Bay Waterway East Side Shoreline Protection	BA-26	SP	NRCS	JEFFERSON	217	N/A	2001	\$5,224,477	The objective of this project is to rebuild the banks of the BBWW to protect the adjacent marsh from excessive tidal action and saltwater intrusion. The project consists of 17,000 (3 miles) of levee constructed with dredged material from the BBWW, and 17,000 (3.3 miles) of rock arm.	2
CWPPIRA	Barataria Basin Landbridge Shoreline Protection, Phases 1 and 2	BA-27	SP	NRCS	JEFFERSON	1304	N/A	2009	\$31,288,623	The objective of the project is to select a cost-effective erosion control technique to stop the erosion on the southwestern shoreline of Bayou Perot and the southeastern shoreline of Bayou Rigolettes. The length of protection is estimated to be approximately 71,000 feet.	2
CWPPIRA	Barataria Basin Landbridge Shoreline Protection, Phase 3	BA-27C	SP	NRCS	JEFFERSON	5887	N/A	1999, 2008, Pending	\$26,351,988	The project tested sections of different shoreline protection types, such as, concrete panel wall, rock and light rock. These projects have constructed over 41,000 feet of shoreline protection.	2
CWPPIRA	Barataria Basin Landbridge Shoreline Protection Phase 4	BA-27D	SP	NRCS	JEFFERSON	589	N/A	2006	\$17,709,216	This project consists of 31,500 feet of foreshore rock dike with a lightweight aggregate core or concrete sheetpile and will incorporate "fish dips" and openings at historic natural channels to eliminate shoreline erosion and deterioration of the Barataria landbridge.	2
CWPPIRA	Vegetative Plantings of a Dredged Material Disposal Site on Grand Terre Island (Deauthorized)	BA-28	VP	NMFS	JEFFERSON	127	N/A	2001	\$526,314	This project involved the installation of vegetative plantings on previously constructed marsh and dune platform.	2
CWPPIRA	La Highway 1 March Creation (Deauthorized)	BA-29	MC	EPA	LAFOURCHE	146	N/A	Deauthorized	\$250,257	The objective of this project was to create marsh habitat in a large open water area adjacent to Louisiana Highway 1 using dredged material from two proposed borrow areas. This project was officially deauthorized by the CWPPIRA Task Force in February of 2005 because it was determined to be uneconomical.	2
CWPPIRA	East/West Grand Tere Islands Restoration (Transferred)	BA-30	MC	NMFS	JEFFERSON	403	N/A	Transferred	\$2,211,739	The goal of this project is to stabilize and benefit 1,575 acres of barrier island habitat and extend the island's life expectancy. Dredged material will be used to create dunes and marsh habitat on East Grand Tere Island. This project was constructed using CJA-P 2007 funds.	2
CWPPIRA	Delta Building Diversion at Myrtle Grove (Transferred)	BA-33	SD	USACE	JEFFERSON, PLAQUEMINES	8891	N/A	Transferred	\$327,422	The objective of this project is to divert Mississippi River water and sediment for the creation of new emergent wetlands. The project will involve: Installation of gated box culverts on the west bank of the Mississippi River in the vicinity of Myrtle Grove, dedicated dredging from the Mississippi River to create marsh in the vicinity of Bayou Lafourche, and the Wilkinson Canal, or a combination of these actions. This project was transferred to the LCA Program.	2
CWPPIRA	Mississippi River Reinroduction Into Northwest Barataria Basin (Transferred)	BA-34	FD	EPA	ST. JOHN THE BAPTIST, ST. JAMES, LAFOURCHE	5134	N/A	Transferred	\$17,098,769	The goal of this project is to restore the natural hydrologic regime and add nutrients to adjacent swamp areas from the Mississippi River. A freshwater diversion/siphon from the Mississippi River to northwest Barataria Basin wetlands with gapping of spoil banks and placement of culverts under LA Highway 20. The scope of the project was changed and the revised project was re-numbered BA-34-2.	2
CWPPIRA	Hydrologic Restoration and Vegetative Plantings in the lac des Allemands Swamp	BA-34-2	HR/ VP	USFWs	ST. JOHN THE BAPTIST, ST. JAMES, LAFOURCHE	5134	N/A	Pending	\$14,355,710	The goal of this project is to restore the natural hydrologic regime and add nutrients to adjacent swamp areas via hydrologic restoration. Project features include the implementation of some bank rays, culverts, and other hydrologic improvements for the impounded swamps to reverse the impoundment effects that are currently serious impediments to swamp health.	2
CWPPIRA	Pass Chaland to Grand Bayou Pass	BA-35	BH	NMFS	LAFOURCHE	359	N/A	2009	\$46,414,530	This project involved the creation of a dune and marsh platform on the north side of the Gulf of Mexico adjacent to Bay Joe Wess. Sand fencing and vegetation were installed.	2
CWPPIRA	Dedicated Dredging on the Barataria Basin Landbridge	BA-36	MC	USFWs	JEFFERSON	2800	N/A	2010	\$36,281,893	Approximately 5,368,000 cubic yards of material was placed in two contained marsh creation areas to construct approximately 1,211 acres of intertidal marsh at a final elevation of +2 ft NAVD 88. Approximately 3,901,000 cubic yards of material was placed in adjoining fill areas to nourish approximately 1,578 acres of marsh.	2
CWPPIRA	Little Lake Shoreline Protection/Dedicated Dredging Near Round Lake	BA-37	MM/ SP	NMFS	LAFOURCHE	713	N/A	2007	\$44,931,412	This project is designed to protect areas which currently experience high rates of shoreline erosion. This project protects approximately 21,000 feet of little lake shoreline, create 1483 acres of intertidal wetlands, and nourish an additional 532 acres of fragmented subtidal marsh.	2
CWPPIRA	Pelican Island and Passa La Mer to Chaland Pass Restoration	BA-38	BH/ VP	NMFS	PLAQUEMINES	1117	N/A	2012	\$22,893,695	The objectives of this project are to create barrier island habitat, enhance storm-related surge and wave protection, prevent overtopping during storms, and increase the volume of sand within the active barrier system. This project was first authorized on the 9th PPL as Barataria Island Restoration Grande Terre to SW (BA-32). Construction of the Pass La Mer to Chaland Pass Restoration Segment was completed in 2007.	2
CWPPIRA	Missionis River Sediment Delivery System - Bayou Ducont	BA-39	MC	EPA	JEFFERSON, PLAQUEMINES	577	N/A	Transferred	\$31,631,908	The goals of this project are to repair breaches and tidal inlets in eh shoreline, reinforce the existing shoreline with sand, and increase the island width with back barrier marsh creation to increase longevity. This project was transferred to the Barrier Program for construction.	2
CWPPIRA	Riveng Sand Mining/Sediefi Island Restoration (Transferring)	BA-40	BH	NMFS	PLAQUEMINES	234	N/A	Transferred	\$40,851,272	The goals of this project are to repair breaches and tidal inlets in eh shoreline, reinforce marsh vegetation.	2

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Improved Levee	Construction Completion	Total Budget	Project Description		Planning Unit
										\$40,538,884	The goals of this project are to create approximately 38 acres of wetlands, reduce tidal exchange in marshes surrounding Lake Hernando using a sediment dredged from the Mississippi River.	
CWPPRA	Lake Hernando Marsh Creation	BA-42	TE, SP, MC	USFWS	PLAQUEMINES	438	N/A	Pending	\$45,671,708	The goal of this project is to create/nourish marsh using sediment hydraulically dredged from the Mississippi River and pumped via pipeline to the ridge area.	2	
CWPPRA	West Pointe a la Hache Marsh Creation	BA-47	MC	NRCS	PLAQUEMINES	203	N/A	Pending	\$36,324,646	This marsh and ridge creation project will nourish approximately 118 acres of marsh and create 15 acres of mainland ridge by long distance pumping of Mississippi River sediment.	2	
CWPPRA	Bayou Dupont Marsh and Ridge Creation Project	BA-48	MC	NMFS	JEFFERSON	317	N/A	Pending	\$41,872,785	This project will create 328 about acres of marsh, nourish about 140 acres of marsh and build about 20,000 ft of ridge.	2	
CWPPRA	Grand Lard Marsh and Ridge Restoration	BA-68	BH	NMFS	PLAQUEMINES	502	N/A	Pending	\$31,145,769	The project goal is to maintain shoreline integrity and create and restore saline marsh on Chenier Ronquille. The project involves dredging of marsh deposits to create saline marsh in open water areas and nourish existing marshes and barrier shoreline in project area. This project area were also proposed. This project was transferred to NRDA for construction.	2	
CWPPRA	Northwest Turtle Bay Marsh Creation	BA-125	MC	USFWS	JEFFERSON	407	N/A	Transferred	\$24,448,757	This project involves the creation of approximately 423 acres and nourish approximately 337 acres of marsh using 9 sediment dredged from Turin Bay or little lake. Existing canal spoil banks, emergent marsh and limited segments of containment dikes will be used to guide the distribution of the dredged material. Containment dikes will be dredged as necessary to re-establish hydrologic connectivity with adjacent wetlands.	2	
CWPPRA	Bayou Dupont Sediment Delivery, Marsh Creation 3	BA-164	MC	EPA	PLAQUEMINES, JEFFERSON	302	N/A	Pending	\$39,529,163	This project involves dredging from nearshore Gulf deposits to create saline marsh in open water areas and nourish barrier shoreline in project area. Intensive dune plantings in this project area were also proposed. This project was transferred to NRDA for construction.	1	
CWPPRA	Caminada Headlands Back Barrier Marsh Creation and Ridge Restoration	BA-171	MC	EPA	LAFOURCHE	430	N/A	Pending	\$32,284,094	This project involves the creation of approximately 300 acres of back barrier intertidal marsh and nourishment of 130 acres of emergent marsh behind 3.5 miles of the Caminada beach using material dredged from the Gulf of Mexico.	2	
CWPPRA	Bayou Grande Cheniere Marsh and Ridge Restoration	BA-173	MC	USFWS	PLAQUEMINES	264	N/A	Pending	\$30,311,402	The goal of this project is to re-create approximately 342 acres of marsh habitat in the open water areas and nourish marsh along the eastern side of the Bayou Grande Cheniere ridge, as well as create 12 acres of forested coastal ridge habitat.	2	
CWPPRA	Cameronton Diversion Outfall Management	BS-03A	OM	NRCS	PLAQUEMINES	802	N/A	2002	\$4,536,000	The primary objective of this project is to enhance marsh by increasing the utilization of freshwater, nutrients, and sediments provided by the Mississippi River through the Cameronton Freshwater Diversion Structure.	1	
CWPPRA	White's Ditch Outfall Management (Deauthorized)	BS-04A	OM	NRCS	PLAQUEMINES	N/A	N/A	Deauthorized	\$32,662,921	This project was deauthorized to direct the flow of Mississippi River nutrients and sediment into the deteriorating wetlands in the Breton Sound Basin that are not directly benefited by the Cameronton Freshwater Diversion project. Because of the failure to secure land rights, the project was officially deauthorized by the CWPPRA Task Force in January of 1998. This project was reauthorized on the 14th FPL as BS-12.	1	
CWPPRA	Grand Bay Crevasses (Deauthorized)	BS-07	SD	USACE	PLAQUEMINES	N/A	N/A	Deauthorized	\$65,4747	Project goals included construction of a rock-lined opening through the rocks at the head of the Jurevich Canal in order to establish a pathway for freshwater and the adjacent marshes to create, restore, and enhance wetlands in the area.	1	
CWPPRA	Upper Oak River Freshwater Siphon (Deauthorized) Phase 1	BS-09	FD	NRCS	PLAQUEMINES	N/A	N/A	Deauthorized	\$56,476	The primary goal of this project was to reverse the trend of interior marsh deterioration in the project area due to saltwater intrusion through installation of a freshwater siphon and outlet channel. These strategies would have provided freshwater, nutrients, and saltmarshes issues.	1	
CWPPRA	Delta Building Diversion North of Fort St. Philip (Deauthorized)	BS-10	SD	USACE	PLAQUEMINES	543	N/A	Deauthorized	\$1,178,640	A diversion channel will be constructed along the left descending water bank up stream from Fort St. Philip. The channel will be constructed mainly through shallow open water and will into the Mississippi River.	1	
CWPPRA	Delta Management at Fort St. Philip	BS-11	SNT	USFWS	PLAQUEMINES	267	N/A	2006	\$3,199,948	The objective of this project is to enhance the delta-building process occurring due to the crevasses at Fort St. Philip. Six artificial crevasses were constructed to divert freshwater and sediment into areas currently restricted by spot banks or natural ridges and linear vegetated banks were constructed to enhance sediment retention and reduce wave energy in one of the receiving bays.	1	
CWPPRA	White Ditch Resurrection and Outfall Management (Deauthorized)	BS-12	OM, FD	NRCS	PLAQUEMINES	189	N/A	Deauthorized	\$1,595,677	The goal of this project was to promote utilization of freshwater, sediments, and nutrients from Mississippi River by renewing operation of existing siphon and adding another. The project was deauthorized by the CWPPRA Task Force in 2013.	1	
CWPPRA	Bayou Lamouche Freshwater Diversion (Transferred)	BS-13	FD	EPA	PLAQUEMINES	620	N/A	Transferred	\$9,509	The goal of this project was to create approximately 620 acres of new marsh, increase the percent cover of aquatic vegetation, increase the area of shallow open water habitat, and decrease mean salinity in the project area. This CWPPRA project was transferred to the CIPAP Program.	1	
CWPPRA	Bohemia Mississippi River Rentroduction Project (Deauthorized)	BS-15	FD	EPA	PLAQUEMINES	640	N/A	Deauthorized	\$556,703	The goal of the project was to reintroduce Mississippi River water into adjacent wetlands through an uncontrolled diversion with a capacity of approximately 10,000 cfs, restoring natural deltaic growth and habitats. The project was deauthorized by the CWPPRA Task Force in 2013.	1	
CWPPRA	South Lake Lery Shoreline and Marsh Restoration	BS-16	VP, MC	USFWS	PLAQUEMINES	652	N/A	Pending	\$33,716,987	This project involves dredging sediment to create 396 acres of marsh and restore approximately 32,000 feet of the southern Lake Lery shoreline.	1	
CWPPRA	Bertrandville Siphon (Deauthorized)	BS-18	FD	EPA	PLAQUEMINES	1613	N/A	Deauthorized	\$22,578,208	The goal of the project was to create and sustain marsh through a MS River reintroduction (2,000 cfs maximum siphon) into the open water near Bertrandville. The project was deauthorized by the CWPPRA Task Force in 2013.	1	
CWPPRA	Terracing and Marsh Creation South of Big Mar	BS-24	MC, TE	USFWS	PLAQUEMINES	383	N/A	Pending	\$22,774,368	This project involves the construction of approximately 65,000 linear feet of terraces (37 acres) with in-situ material to reduce fetch and turbidity and capture dispersed sediment. Sediments will be hydraulically dredged from Lake Lery and pumped via pipeline to create and restore approximately 334 acres of marsh in the project area.	2	
CWPPRA	Cameron Creole Maintenance	CS-04A	HR	NRCS	CAMERON	2602	N/A	1997-2011	\$4,644,371	The project area falls within the Cameron Creole watershed management area which has been severely impacted by saltwater intrusion and loss of sediments due to channelization and water diversion of the Calcasieu River. The project provide maintenance for the existing 19 miles of levee and five major structures which make up the Cameron-Creole Watershed Project.	4	
CWPPRA	Brown Lake Hydrologic Restoration (Deauthorized)	CS-09	MM	NRCS	CALCASIEU, CAMERON	916	N/A	Deauthorized	\$1,087,828	The project investigated the restoration of the natural hydrology of the Brown Lake area. The project was deauthorized by the CWPPRA Task Force.	4	
CWPPRA	Sweet Lake/Willow Lake Hydrologic Restoration	CS-11B	SP	NRCS	CAMERON	247	N/A	2002	\$3,929,152	The project objectives are to re-establish the shoreline hydrologic boundary between Sweet Lake and the Gulf Intracoastal Waterway (GIWW), to reduce lake turbidity and tidal exchange, and to halt erosion and trap sediment needed to rebuild marsh along the northern and northwestern shorelines of Sweet Lake. This project includes construction of rock embankments on the GIWW to close off the lakes, vegetation plantings to reduce erosion, and construction of earthen terraces combined with vegetation plantings in open water areas to promote revegetation.	4	
CWPPRA	Cameron Creole Plugs	CS-17	HR	USFWS	CAMERON	865	N/A	1997	\$418,539	The project goal is to restore historic water circulation patterns within the Cameron-Creole Watershed. This objective will be accomplished by slowing the rapid movement of saline waters that enter the watershed from Carcasieu Lake. The project consisted of the installation of two sheet piles in the artesian borrow canal.	4	
CWPPRA	Sabine National Wildlife Refuge Erosion Protection	CS-18	SP	USFWS	CAMERON	5542	N/A	1995	\$1,602,656	The goal of this project is to protect 13,000 acres of fresh marsh from deterioration associated with the anticipated failure of the existing west levee. The original design was to reconstruct 5.5 miles of eroded levee. The project was redesigned to include 1,000 feet of levee reconstruction and 5.5 miles of rock armor. Vegetation plantings were used to reduce erosion from boat traffic.	4	
CWPPRA	West Hackberry Vegetative Planting Demonstration	CS-19	VP	NRCS	CAMERON	N/A	N/A	1994	\$256,250	The goal of this demonstration project is to reduce marsh erosion from interior open water wave energy using vegetation plantings consisting of California bulrush (<i>Schoenoplectus californicus</i>). In addition, wave-stilling hay bale fences were utilized to protect the vegetation plantings.	4	
CWPPRA	East Mud Lake Marsh Management	CS-20	MM	NRCS	CAMERON	1520	N/A	1993	\$5,392,765	The project involves the creation of a hydrologic structure and vegetative plantings. Structural components include culverts with gate, two variable crest level, three earthen plugs, overflow bank, and repair of existing levee.	4	
CWPPRA	Highway 344 Hydrologic Restoration	CS-21	MM	NRCS	CAMERON	650	N/A	2000	\$1,551,196	The project purpose is to restore the natural hydrology of the project area and eliminate undesirably high salinities and severe water fluctuations, fundamentally reduce the potential for future marsh losses.	4	

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Construction Completion	Miles of Levee Improved	Project Description		Planning Unit
									Total Budget		
CWPPRA	Clear Marsh Bank Protection	CS-22	SP	USACE	CALCASIEU	1067	N/A	1997	\$3,696,088	The project is located north of the Gulf Intracoastal Waterway (GIWW) approximately 10 miles northwest of Hackberry in Calcasieu Parish, Louisiana. The goal of this project is to extend the rock armored shoreline stabilization by one mile adjacent to the GIWW to prevent continued erosion of the GIWW levees and to prevent the encroachment of the GIWW into the marshes north of the project area.	4
CWPPRA	Replace Sabine Rotule Water Control Structures at Headquarters, Canal West Cove Canal, and Hog Island Gully	CS-23	MM	USFWS	CAMERON	953	N/A	2001	\$5,709,396	This project involved the replacement of existing structures at Sabine National Wildlife Refuge with structures that have substantially greater discharge potential and greater management flexibility.	4
CWPPRA	Perry Ridge Shore Protection	CS-24	SP	NRCS	CALCASIEU	1203	N/A	1999	\$2,289,090	The project reduces tidal scour, wave action from boats, and other excessive energy impacts on interior marshes and the possibility of saltwater intrusion by placing rip rap along low areas on the northern spit bank of the GIWW from Perry Ridge to Union Drainage Canal.	4
CWPPRA	Plowed Terraces Demonstration	CS-25	SNT	NRCS	CAMERON	N/A	N/A	2000	\$325,641	This objective of this demonstration project is to develop and demonstrate a non-traditional procedure for constituting earthen terraces in shallow open water areas. Thirty-eight earthen terraces served as wave-silting sediment trapping structures and provided a medium base for the establishment of emergent vegetation.	4
CWPPRA	Compost Demonstration (Deauthorized)	CS-26	MC	EPA	CAMERON	N/A	N/A	Deauthorized	\$255,390	This project was authorized to evaluate the effectiveness of using tree trimmings as composite material, using compost amended material in providing a growth medium or emergent vegetation, and determining settlement rates of the compost amended materials and tree trimmings. This project was officially deauthorized by the CWPPRA Task Force in January 2002.	4
CWPPRA	Black Bayou Hydrologic Restoration	CS-27	HR	NMFS	CALCASIEU, CAMERON	3594	N/A	2003	\$6,170,284	The project goals are to reduce wetland loss resulting from hydrologic changes including freshwater inflow, increased magnitude and duration of tidal fluctuations, increased salinities, higher water levels, weirs, plugs, and culverts designed to allow freshwater from the Gulf Intracoastal Waterway (GIWW) into the wetlands and to create a hydrologic head that increases freshwater retention time and reduces saltwater intrusion.	4
CWPPRA	Sabine Refuge Marsh Creation, Cycles 4-5	CS-28	MC	USACE	CAMERON	460	N/A	Pending	\$11,838,649	The Sabine Refuge Marsh Creation Cycles 1-3 Project consists of the placement of dredged material from routine maintenance of the Calcasieu River Ship Channel into a marsh creation site within the Sabine National Wildlife Refuge.	4
CWPPRA	Sabine Refuge Marsh Creation, Cycles 1-3	CS-28-1	MC	USACE	CAMERON	662	N/A	2002, 2010	\$24,627,398	The Sabine Refuge Marsh Creation Cycles 1-3 Project consists of the placement of dredged material from routine maintenance of the Calcasieu River Ship Channel into a marsh creation site within the Sabine National Wildlife Refuge.	4
CWPPRA	Black Bayou Culverts Hydrologic Restoration	CS-29	HR	NRCS	CALCASIEU	540	N/A	2007	\$16,399,055	This project involved the construction of 10 box culverts (10' x 10' ft) with flap gates in the embankment of Highway 364 in Cameron Parish.	4
CWPPRA	GIWW - Perry Ridge West Bank Stabilization	CS-30	SP	NRCS	CALCASIEU	1132	N/A	2001	\$2,286,216	The project consists of installing rock along the bank of the GIWW to prevent further erosion.	4
CWPPRA	Holy Beach Sand Management	CS-31	SP	NRCS	CAMERON	330	N/A	2003	\$14,130,233	The purpose of the project is to protect existing coastal wetlands by restoring and maintaining the integrity and functionality of the remaining channel/beach ridge. This objective was accomplished through beach renourishment, installation of sand fencing, vegetation plantings, and monitoring of the shoreline response. This project was originally authorized on the 9th PPL as the complex project - Holy Beach Project, MC-01.	4
CWPPRA	East Sabine Lake Hydrologic Restoration OU1	CS-32-CU1	TE, HR	USFWS	CAMERON	281	N/A	2009	\$4,944,970	The objectives of this project are to protect and restore area protection, terraces, hydrological regime, and water control structures to reduce tidal scour, shoreline erosion, turbidity, and salinities. However, design of the water control structures has been discontinued and the remaining construction funds were used to build additional terraces.	4
CWPPRA	Cameron-Creole Freshwater Intertidal	CS-49	VP, FD	NRCS	CAMERON	473	N/A	Pending	\$14,037,945	The purpose of this project is to restore the function, value and sustainability to approximately 22,247 acres of marsh and open water by improving hydrologic conditions via freshwater input and increasing organic productivity.	4
CWPPRA	Kelso Bayou Marsh Creation and Hydrologic Restorations	CS-53	MC, SP	NRCS	CAMERON	274	N/A	Pending	\$17,882,765	The goal of this project is to restore and protect approximately 179 acres of critically important marsh and the numerous functions provided by those acres. The proposed project will restore a portion of the historic meandering channel of Kelso Bayou and provide direct protection to Louisiana State Highway 27, the region's only northward hurricane evacuation route.	4
CWPPRA	Cameron-Creole Watershed Grand Bayou Marsh Creation	CS-54	MC	USFWS	CAMERON	534	N/A	Pending	\$22,918,897	Project goals include creating 609 acres of brackish marsh and nourishing 7 acres of brackish marsh with dredged material from Calcasieu Lake to benefit fish and wildlife resources in the Cameron Prairie National Wildlife Refuge and adjacent prairies of the Calcasieu Lake estuary.	4
CWPPRA	Oyster Bayou Marsh Creation and Terracing	CS-59	MC, SNT	NMFS	CAMERON	489	N/A	Pending	\$31,031,354	The project consists of creating/nourishing marsh and associated edge habitat and creating terraces in order to reduce wave/wave erosion.	4
CWPPRA	Cameron Meadows Marsh Creation and Terracing	CS-66	MC, TE	NOAA	CAMERON	401	N/A	Pending	\$28,935,320	This project involves the construction of 334 acres of marsh and the reestablishment of Old North Bayou via dredged material from the Gulf of Mexico. The project also involves the construction of 35,000 linear feet of terraces (18' acres) to reduce wave generated wave fetch.	4
CWPPRA	Nutria Harvest for Wetland LA-03A	OT	USFWS	COASTWIDE	N/A	N/A	2003	\$806,220	This project enables the Louisiana Department of Wildlife and Fisheries to establish an economic incentive program to trap and control nutria, which are contributing to coastal wetland loss, by promoting the consumption of nutria meat.	COASTWIDE	
CWPPRA	Coastwide Nutria Control Program	LA-03B	MM	NRCS	COASTWIDE	14963	N/A	N/A	\$88,736,156	Project goal is to harvest approximately 400,000 nutria tails annually. Damage inflicted by nutria is estimated to be reduced 25 to 49%.	COASTWIDE
CWPPRA	Floating Marsh Creation Demonstration	LA-05	OT	NRCS	TERREBONNE	N/A	N/A	2006	\$1,080,891	The purpose of this demonstration project was to develop and test unique and previously untested technologies for creating floating marsh made of buoyant vegetated mats or artificial islands.	3A
CWPPRA	Shoreline Protection Foundation Improvements	LA-06	SP	USACE	VERMILION	0	N/A	2006	\$1,055,000	The purpose of the project is to investigate the potential to improve the foundation of rock dikes. The project was paired with the South White Lake Shoreline Protection (ME-22) project.	4
CWPPRA	Bioengineered Oyster Reef Demonstration	LA-08	SP	NMFS	CAMERON	4.5	N/A	2012	\$2,316,992	This project is intended to evaluate the Oysterbreak structure to prevent beach erosion and increase habitat diversity associated with natural oyster reefs.	4
CWPPRA	Sediment Containment System for Marsh Creation Demonstration	LA-09	MC	NRCS	ST CHARLES	N/A	N/A	2013	\$2,323,073	This demonstration project utilizes an unconventional sediment containment system for marsh creation.	3A
CWPPRA	Non-rock Alternatives to Shoreline Protection Demo	LA-16	SP	NRCS	IERIA, JEFFERSON, LAFOURCHE COASTWIDE	779	N/A	2014	\$6,233,700	Project goals are to demonstrate different alternatives to rock, shoreline protection methods by testing several different products along highly erosive shorelines in areas that are not conducive to construction with rock.	2, 3B
CWPPRA	Coastwide Planning	LA-39	VP	NRCS	IERIA, JEFFERSON, LAFOURCHE COASTWIDE	779	N/A	N/A	\$12,689,728	The goals of this project are to facilitate a consistent and responsive planning effort in coastal Louisiana that is flexible enough to routinely plan on a large scale and able to rapidly respond to "hot spots" following storms or other damaging events.	COASTWIDE
CWPPRA	Freshwater Bayou Wetland Protection	ME-04	SP	NRCS	VERMILLION	14381	N/A	1993	\$6,035,584	The project includes the installation of 10,000 linear feet of rock breakwater (riparian) along the west shoreline of Freshwater Bayou Canal, where needed, to protect this shoreline from further erosion, and the installation of gated water control structures on the Acadia and Marina Canal to reduce flooding in this area known as the Freshwater Bayou Wetlands.	4
CWPPRA	Dewitt-Rolover Vegetative Plantings Demonstration (Deauthorized)	ME-08	VP	NRCS	VERMILLION	102	N/A	1994, Deauthorized	\$92,147	This demonstration project's purpose was to investigate the ability of vegetation plantings (spatia alienifolia) to colonize a newly accreted mudflat, thereby establishing a vegetation buffer between the Gulf of Mexico and coastal wetlands. This project was officially deauthorized by the CWPPRA Task Force in February 1996 because no plants remained.	4
CWPPRA	Cameron Prairie National Wildlife Refuge Shoreline Protection	ME-09	SP	USFWS	CAMERON	640	N/A	1994	\$1,227,123	This project protects the emergent wetlands of the Cameron Prairie National Wildlife Refuge adjacent to the GIWW, enhances the emergent wetlands protected by constructing approximately 2.5 miles of rock dike parallel to the existing spoil bank, and terminates the encroachment of the GIWW into the refuge.	4
CWPPRA	Humble Canal Hydrologic	ME-11	HR	NRCS	CAMERON	378	N/A	2003	\$1,500,612	The project consists of replicating the existing Humble Canal structure to restore water management capabilities to the area.	4
CWPPRA	Southwest Shore White Lake Demonstration (Deauthorized)	ME-12	SP	NRCS	IERIA	N/A	N/A	1996, Deauthorized	\$4,177	The objective of this demonstration project was to stabilize one mile of the White Lake shoreline and prevent breaching of the GIWW. The project was initiated to determine if California bulrush (<i>Schoenoplectus californicus</i>) is effective at damping high energy wave action. The project was officially deauthorized by the CWPPRA Task Force in October of 1998 and is no longer monitored.	4

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRAs Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Levee Improved	Construction Completion	Total Budget	Project Description	Planning Unit
CWPPRA	Freshwater Bayou Bank Stabilization	ME-13	SP	NRCS	VERMILION	511	N/A	19983	\$5,609,584	The goal of this project is to stop erosion along the bank of Freshwater Bayou Canal and to protect the interior wetlands from saltwater intrusion, increased tidal exchange and wave-induced erosion. This was achieved by constructing a rock dike along critical areas of the eastern and western banks of the canal.	4
CWPPRA	Pecan Island Terracing	ME-14	TE	NMFS	VERMILION	437	N/A	2003	\$2,390,964	The goal of this project is to convert areas of open water back to vegetated marsh. Project features included the construction of earthen terraces to reduce wave action. Terraces were constructed in a staggered gap formation and planted with smooth cordgrass (Spartina alterniflora) and California Bulrush (Schoenoplectus californicus).	4
CWPPRA	Freshwater Introduction South of Highway 82	ME-16	HR	USFWS	IERIA	296	N/A	2006	\$6,342,505	The purpose of this project was to move freshwater from White Lake across LA Hwy 82 to target marshes and marsh restoration through earthen terraces.	4
CWPPRA	Little Pecan Bayou Hydrologic Restoration (Deauthorized)	ME-17	HR	NRCS	CAMERON	144	N/A	Deauthorized	\$1,303,713	The purpose of the project was to introduce fresh water into brackish marsh habitat south of LA Highway 82 through use of water control structures and conveyance channels. The project was subsequently deauthorized by the CWPPRA Task Force.	4
CWPPRA	Rockefeller Refuge Tuff Shoreline Stabilization	ME-18	SP	NMFS	CAMERON	863	N/A	Pending	\$26,776,463	The purpose of the project is to construct a continuous near shore breakwater along the Gulf of Mexico shoreline, approximately 50.691 feet from Beach Prong to Joseph Harbor.	4
CWPPRA	Grand White Lakes Landbridge Protection	ME-19	SP	USFWS	CAMERON	213	N/A	2004	\$3,536,830	The purpose of the project was to prevent the coalescence of Grand and White Lakes through the installation of 11,000 feet of hard shoreline stabilization and construction of terraces.	4
CWPPRA	South White Lake Shoreline Hydrologic Restoration	ME-20	HR/MC	USFWS	VERMILION	440	N/A	Pending	\$23,873,346	The objective of this project is a reduction in salinity in target marshes via a fresh water introduction from Upper Mud Lake via the Dr. Miller Canal and culverts under Hwy 82. Restoration of 402 acres of brackish marsh from shallow open water and nourishment of 51 acres of marsh (total 455 acres) in two cells (176 and 277 acres) via 1.5 M cubic yards of dredged material from a Gulf of Mexico borrow site.	4
CWPPRA	Grand Lake Shoreline Protection, Tebo Point	ME-21	SP	NRCS	CAMERON	495	N/A	Pending	\$11,305,616	This project involves the construction of a rock dike to protect the south shoreline of Grand Lake from Catfish Lake to Tebo Point and perform long-term OEM on this dike as well as a separate portion from Superior Canal to Catfish Lake (constructed using CMAP 2007 funds).	4
CWPPRA	South White Lake Shoreline Protection	ME-22	SP	USACE	VERMILION	844	N/A	2006	\$19,673,961	This project involved the construction of a rock dike along the south shoreline of White Lake to reduce erosion and maintain shoreline integrity.	4
CWPPRA	South Pecan Island and Freshwater Introduction (Deauthorized)	ME-23	FD	NMFS	CAMERON	98	N/A	Deauthorized	\$4,438,693	The purpose of the project was to introduce freshwater from the lakes subbasin north, under Hwy. 82 and into the lakes subbasin south of Hwy. 82. The project was officially deauthorized by the CWPPRA Task Force in January of 2011.	4
CWPPRA	Southwest Louisiana Gulf Shoreline Nourishment and Protection	ME-24	OT	USACE	IERIA	888	N/A	Pending/On Hold	\$17,144,234	The goal of the project is to nourish 47,800 linear feet of gulf shoreline with sediment between Dewitt Canal and Big Constance Lake, and create approximately 42 acres of marsh platform, mud flat and shallow water, extending approximately 384 feet seaward. The objective of this project is a reduction in salinity in target marshes via a fresh water introduction from Upper Mud Lake via the Dr. Miller Canal and culverts under Hwy 82. Restoration of 402 acres of brackish marsh from shallow open water and nourishment of 51 acres of marsh (total 455 acres) in two cells (176 and 277 acres) via 1.5 M cubic yards of dredged material from a Gulf of Mexico borrow site.	4
CWPPRA	Creation Freshwater Bayou Marsh	ME-31	MC	NRCS	VERMILION	401	N/A	Pending	\$26,756,528	The purpose of this project is to create and/or nourish about 400 acres of marsh near Freshwater Bayou north of intersection with Humble Canal.	4
CWPPRA	South Grand Chenier Marsh Creation - Bear Tract	ME-32	MC	NRCS	CAMERON	393	N/A	Pending	\$26,691,833	The purpose of this project is to create new wetland habitat, restore degraded marsh, and reduce wave erosion. Material dredged from the Gulf of Mexico will be utilized to create and nourish approximately 420 acres of marsh. Rehabilitation work will be dredged and approximately 11,756 linear feet of tidal creeks will be constructed by dredging marsh buggies on the marsh platform for estuarine fisheries access. Smooth cordgrass plugs will be planted on 20-foot centers throughout the area (total 49,268 plants).	4
CWPPRA	West Bay Sediment Diversion	MR-03	SD	USACE	PLAQUEMINES	9831	N/A	2003	\$50,863,503	The project consists of a conveyance channel for large-scaled diversion of freshwater and sediments from the Mississippi River. The diversion channel was designed to be constructed in two phases: (1) initial construction of an interim channel to accommodate a discharge of 20,000 cubic feet per second (cfs) at the 50% duration stage of the diversion operations, and (2) Modification of the interim diversion channel design to accommodate a full-scale diversion of 50,000 cfs at the 50% duration stage on the river after a period of intensive monitoring of diversion operations.	2
CWPPRA	Channel Armor Gap Crevasse	MR-06	SD	USACE	PLAQUEMINES	2097	N/A	1997	\$17,144,234	The project consists of deepening the invert of the existing 150 foot wide gap in the Mississippi River channel Dark armor. The existing invert was lowered to -4.0 feet NGVD. In addition, an existing earthen channel leading from the armored gap to the open water area beyond the bank were enlarged. Approximately 125,000 cubic yards of material were excavated from the outfall channel and cast adjacent to the channel in a manner conducive to marsh nourishment.	1
CWPPRA	Pass-a-Louise Crevasse (Deauthorized)	MR-07	SD	USACE	PLAQUEMINES	1043	N/A	Deauthorized	\$119,835	The objective of this project was to create and restore marsh in the Mississippi River Delta. This was to be accomplished through construction of a crevasse on the left descending bank of the Mississippi River between Pass-a-Louise and Raphel Pass. The project was officially deauthorized by the CWPPRA Task Force in July of 1998 due to high costs attributed to dredging underground utilities in the area.	1
CWPPRA	Beneficial Use of Hopper Dredged Material Demonstration	MR-08	DM	USACE	PLAQUEMINES	N/A	N/A	Deauthorized	\$88,985	The project consists of deepening the invert of the existing 150 foot wide gap in the Mississippi River channel Dark armor. The existing invert was lowered to -4.0 feet NGVD. In addition, an existing earthen channel leading from the armored gap to the open water area beyond the bank were enlarged. Approximately 125,000 cubic yards of material were excavated from the outfall channel and cast adjacent to the channel in a manner conducive to marsh nourishment.	1
CWPPRA	Delta Wide Crevasses	MR-09	SD	NMFS	PLAQUEMINES	2386	N/A	1999	\$47,284,318	The objective of this project is to promote the formation of emergent freshwater and intermediate marsh in shallow, open water areas of the Pass-a-Louise Wildlife Management Area and the Delta National Wildlife Refuge by either cleaning existing slays or creating new ones.	1
CWPPRA	Dustpan Maintenance Dredging Operations for Marsh Creation in the Mississippi River Delta Demonstration	MR-10	DM	USACE	PLAQUEMINES	N/A	N/A	2002	\$1,909,020	This project demonstrated the beneficial use of dredged material from routine maintenance of the Mississippi River Navigation Channel by using a dustpan hydraulic dredge to create and restore adjacent marsh. Approximately 44 acres of deteriorated marsh had converted to shallow open water were restored with approximately 222,000 cubic yards of dredged material.	2
CWPPRA	Periodic Introduction of Sediment and Nutrients at Selected Diversion Sites (Demonstrations/Deauthorized)	MR-11	FD	USACE	ST BERNARD	N/A	N/A	Deauthorized	\$83,556	This demonstration project was intended to show the effectiveness of using a hydraulic pipeline dredge to provide increased sediment through diversion structure or siphon. Monitoring of the project will determine not only the characteristics of the sediment input concentrations, but also the subsequent effects in the outfall area. The project was subsequently deauthorized by the CWPPRA Task Force.	1
CWPPRA	Mississippi River Sediment Trap (Deauthorized)	MR-12	MC	USACE	PLAQUEMINES	1190	N/A	Deauthorized	\$54,4790	This project was reauthorized on the 12th PPL to create emergent wetlands through diverting Mississippi River water and sediment from Grand Pass into an area dredged out of the riverbed that will force sediment deposition. The project was officially deauthorized by the CWPPRA Task Force in 2009 due to the high cost to implement the project.	1, 2
CWPPRA	Bennetts Bay Diversion (Deauthorized)	MR-13	SD	USACE	PLAQUEMINES	4580	N/A	Deauthorized	\$976,580	The objective of this project was to create vegetated wetlands in shallow open water areas in Bennetts Bay. The project would divert sediment in an effort to create, nourish, and maintain approximately 16,982 acres of fresh to intermediate marsh over the 20+ year project life. The project was deauthorized by the CWPPRA Task Force in 2013.	1
CWPPRA	Spanish Pass Diversion (Deauthorized)	MR-14	SD	USACE	PLAQUEMINES	433	N/A	Deauthorized	\$128,626	The goal of this project was to create emergent marsh by diverting Mississippi River water and sediment from Grand Pass into water receiving areas. The project was deauthorized by reducing channel flow and routing the diverted flow across marshes or through shallow water areas instead of through larger channels. This project was officially deauthorized by the CWPPRA Task Force in 2013.	2
CWPPRA	Venice Ponds Marsh Creation and Crevasses (Inactive)	MR-15	MC	EPA	PLAQUEMINES	511	N/A	Inactive	\$23,442,176	The goal of the project is to create, maintain, nourish, and replenish existing deteriorating wetlands through dedicated dredging, hydrologic restoration, crevase construction, and crevassle enhancement. The project was designated as inactive by the CWPPRA Task Force in 2013.	2
CWPPRA	Fritchie Marsh Restoration	PO-06	HR	NRCS	ST TAMMANY	1040	N/A	2001	\$2,201,674	The purpose of the project is to achieve remediation of the causes of wetland loss in the area and to improve habitat for wildlife and fishery by increasing the flow of fresh water into the marsh and managing the outfall.	1
CWPPRA	Violet Freshwater Distribution (Deauthorized)	PO-09A	HR	USFWS	ORLEANS	4580	N/A	Deauthorized	\$128,626	The objective of the outfall management plan was to optimize the use of freshwater and sediment supplied by the existing siphons by managing flow through the area. This would be accomplished by reducing channel flow and routing the diverted flow across marshes or through shallow water areas instead of through larger channels. This project was officially deauthorized by the CWPPRA Task Force in 2013.	1
CWPPRA	Bayou Sauvage National Wildlife Refuge Hydrologic Restoration, Phase 1	PO-16	HR	USFWS	ORLEANS	3800	N/A	1994	\$1,680,193	The Lake Ponchartrain Hurricane Protection levee isolates units 3 and 4 of the Bayou Sauvage Wildlife Refuge from the surrounding marsh complex and establishes a large freshwater impoundment. This project established a means for removing the excess water during the spring and summer.	1
CWPPRA	Bayou LBR/Brache Wetland Creation	PO-17	MC	USACE	ST CHARLES	487	N/A	1997	\$3,934,000	The project involved dredging sediments from Lake Ponchartrain to create vegetated wetlands in an area roughly bounded by I-10, Lake Ponchartrain, Bayou Labanche.	1
CWPPRA	Bayou Sauvage National Wildlife Refuge Hydrologic Restoration, Phase 2	PO-18	HR	USFWS	ORLEANS	1280	N/A	1997	\$1,692,552	The construction of U.S. Highway 90, canals, railroad lines and Lake Ponchartrain hurricane protection levees has impounded the marsh in the project area. Project features consists of two 36-inch pumps, which operate to maintain water levels at 0.5 feet above or below marsh elevation to promote vegetative growth in the project area.	1

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CWPPRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Improved Levee	Construction Completion	Total Budget	Planning Unit
CWPPRA	Mississippi River Gulf Outlet (MRGO) Disposal Area Marsh Protection	PO-19	MM	USACE	ST BERNARD	755	N/A	1999	\$318,445	The objective of this project is to preserve vegetated wetlands by repairing the lateral and rear dikes of the Mississippi River Gulf Outlet (MRGO) disposal areas. Repairs to a 28,000 linear-foot dike, in conjunction with the installation of metal box walls with a single 40-inch pipe, were used to control and divert water flow to prevent the perched marshes from draining.
CWPPRA	Red Mud Demonstration (Deauthorized)	PO-20	MC	EPA	ST. JOHN THE BAPTIST	N/A	N/A	Deauthorized	\$20,129	This project was authorized to determine whether red mud, produced as a by-product of removing alumina from bauxite, could be utilized as marsh-recreation material in combination with compost and marsh sediment. Construction of experimental units was initiated in 1997; however, due to unexpected problems with fill materials, liners, and contaminants in the water source, the project was officially deauthorized by the CWPPRA Task Force in August 2001.
CWPPRA	Eden Isles East Marsh Restoration (Deauthorized)	PO-21	HR	NMFS	CAMERON	1453	N/A	Deauthorized	\$39,025	The project intended to restore 1,556 acres of drained saltlands by actively managing water levels to maximize marsh creation. There was a change in landowners of the project area during the planning phase of this project. Consequently, the project was officially deauthorized by the CWPPRA Task Force in January 1998.
CWPPRA	Bayou Cheve Shorline Protection	PO-22	SP	USACE	ORLEANS	212	N/A	2001	\$2,589,403	The project consists of constructing a 5,000-foot earthen, erodible dike to contain dredged material from Lake Pontchartrain. The project created about 150 acres of marsh.
CWPPRA	Hopedale Hydrologic Restoration	PO-24	HR	NMFS	ST BERNARD	106	N/A	2005	\$2,281,287	This project is designed to abate site-specific wetland loss by replacing collapsed culverts installed in the 1950s near Yscobiskey, Louisiana. Replacement of these structures would allow more rapid drainage of the area, improve fisheries access, reduce wetland loss rates, and protect approximately 3,085 acres of marsh.
CWPPRA	Bayou Bienville Pump Station Diversion and Terracing (Deauthorized)	PO-25	MC	NMFS	TERREBONNE	442	N/A	Deauthorized	\$2,12,152	This project intended to combine the use of existing pump stations with the construction of a diversion channel, water control structures, and earthen terraces planted with smooth cordgrass (Spartina alterniflora). This would force the flow of freshwater and nutrients through a deteriorated marsh area to abate site-specific marsh loss. The project was officially deauthorized by the CWPPRA Task Force in April 2002 because construction was determined to be 100% costly.
CWPPRA	Opportunistic Use of the Bonnet Carré Spillway (Deauthorized)	PO-26	FD	USACE	PLAQUEMINES	177	N/A	Deauthorized	\$839,927	This project intended to alleviate high salinity stress on the vegetated wetlands surrounding Lake Pontchartrain. This objective was to be accomplished through the removal of pins from the Bonnet Carré Spillway structure during high flow periods in the Mississippi River to allow no more than 4,000 cubic feet per second of water to flow from the river into Lake Pontchartrain. This project was officially deauthorized by the CWPPRA Task Force in October of 2007 due to uncertainty of benefits and lack of funder/owner support.
CWPPRA	Chandeleur Islands Marsh Restoration	PO-27	VP	NMFS	ST BERNARD	88	N/A	2001	\$39,927	The objective of this project was to accelerate the recovery period of barrier island areas overwhelmed by Hurricane Georges in 1998 through vegetation plantings. The overwash areas, which encompass 365 acres, are located at 22 sites along the Chandeleur Sound side of the island chain and were planted with smooth cordgrass (Spartina alterniflora).
CWPPRA	LaBranch Wetlands Terracing, Planting, and Shoreline Protection (Deauthorized)	PO-28	VP	NMFS	ST CHARLES	489	N/A	Deauthorized	\$30,636	This project intended to reduce emergent marsh loss along the shoreline by restoring and creating 89 acres through marsh terracing, shoreline protection, and vegetation planting. This project was officially deauthorized by the CWPPRA Task Force in October 2007.
CWPPRA	Lake Borgne Shoreline Protection	PO-30	SP	EPA	ST BERNARD	229	N/A	2008	\$28,908,775	The goal of this project is to maintain the integrity of the narrow strip of marsh that separates Lake Borgne from the Mississippi River Gulf Outlet (MRGO). This land helps protect the communities of Shell Beach, Yscobiskey, and Hopefield from direct exposure to lake wave energy and storm surges. The goal was accomplished through construction of a continuous nearshore rock breakwater.
CWPPRA	Lake Borgne and MRGO Shoreline Protection (Deauthorized)	PO-32	SP	USACE	ST BERNARD	93	N/A	Deauthorized	\$1,089,193	The objective of this project was to preserve the marsh between Lake Borgne and the Mississippi River Gulf Outlet (MRGO) by constructing a rock dike along the Lake Borgne shoreline and the northern bank of the MRGO. The Lake Borgne segment of this project was constructed by the USACE with funds from the 3rd supplemental, and the remaining portion of the project was deauthorized by the CWPPRA Task Force.
CWPPRA	Goose Point/Pont Pierre Marsh Creation	PO-33	MC	USFWS	ST TAMMANY	436	N/A	2009	\$15,979,442	The primary goal of the project is to create about 437 acres of marsh and nourish about 114 acres of degraded marsh along the northern shore of Lake Pontchartrain.
CWPPRA	Alligator Bend Marsh Restoration and Shoreline Protection	PO-34	TE, VP, SP	NRCS	ORLEANS	121	N/A	Pending	\$39,771,652	The goal of this project is to create about 143 acres of marsh and nourish about 762 acres of marsh along the northern shore of Lake Pontchartrain. The goal of this project is to provide shoreline protection in Lake Borgne, starting at Alligator Point, using rock dikes and vegetative plantings.
CWPPRA	LaBranch East Marsh Creation	PO-75	MC	NRCS	ST CHARLES	715	N/A	Pending	\$33,555,033	Project features consist of the creation of 229 acres of marsh and the nourishment of 240 acres of existing marsh using dedicated dredging from Lake Pontchartrain.
CWPPRA	Bayou Bonitoa Marsh Creation	PO-104	MC	USFWS	ST TAMMANY	424	N/A	Pending	\$29,273,884	The primary goal of the project is to create 533 acres and nourish .24 acres of low salinity brackish marsh in open water areas adjacent to Bayou Point au Chien just south of its junction with St. Louis Canal, the relief structure on Grand Bayou, and the pipeline structure on Grand Bayou Canal. The project has been deauthorized by the CWPPRA Task Force.
CWPPRA	LaBranch Central Marsh Creation	PO-133	MC	NRCS	ST CHARLES	731	N/A	Pending	\$43,409,208	Project features include the creation of 762 acres of marsh and the nourishment of 240 acres of existing marsh using dedicated dredging from Lake Pontchartrain.
CWPPRA	Grand Bayou Hydrologic Restoration (Deauthorized)	TE-10	HR	USFWS	LAFOURCHE	199	N/A	Deauthorized	\$1,452,357	The objective of this project was to maintain emergent wetlands in this area by providing supplemental freshwater, nutrients, and sediment from the Atchafalaya River via the Gulf Intracoastal Waterway (GIWW). Project features included a water control structure on Bayou Pointe au Chien just south of its junction with St. Louis Canal, the relief structure on Grand Bayou, and the pipeline structure on Grand Bayou Canal. The project has been deauthorized by the CWPPRA Task Force.
CWPPRA	Faigout Canal Planting Demonstration	TE-17	VP	NRCS	TERREBONNE	N/A	N/A	1999	\$206,522	For this demonstration project, smooth cordgrass (Spartina alterniflora) suited to the salinity and habitat type of the Faigout Canal area was planted along the canal and protected by six types of wave-silting devices.
CWPPRA	Timbalier Island Planting Demonstration	TE-18	VP	NRCS	TERREBONNE	N/A	N/A	1999	\$30,492	For this demonstration project, approximately 7,390 linear feet of sand fences were installed and vegetation suited to the salinity and habitat type of Timbalier Island was planted in several areas on the island to trap sand and buffer wind and wave energy.
CWPPRA	Lower Bayou LaCache Hydrologic Restoration (Deauthorized)	TE-19	MM	NMFS	TERREBONNE	N/A	N/A	Deauthorized	\$99,625	The project would have reduced marsh loss rates and improved fish and wildlife habitat quality by restoring natural north-south water exchange with estuarine water bodies and by reducing flow through the numerous dredged canals in the area. Because of problems with dredging and navigation, the project was officially deauthorized by the CWPPRA Task Force in 1996.
CWPPRA	Isles Derniers Restoration East Island	TE-20	BH	EPA	TERREBONNE	449	N/A	1999	\$8,762,416	The project objective is to restore the coastal dunes and wetlands of the Eastern Isles Derniers barrier island chain. Approximately 3.9 million cubic yards of sand were dredged from Lake Pele and used to build a retaining dune which was then hydraulically filled to create an elevated marsh platform. Sand fences and vegetation were also installed to stabilize the sand and minimize wind-driven transport.
CWPPRA	Point Au Fer Canal Plugs	TE-22	VP, MC	NMFS	TERREBONNE	375	N/A	1997	\$5,545,361	This project is intended to reduce saltwater intrusion into the Point Au Fer marshes without reducing freshwater flooding from the Atchafalaya River. Phase I of this project, completed in 1997, involved the plugging of two major natural gas/oil pipeline canals on the eastern half of the island. Under Phase II, a rock shoreline stabilization structure was constructed in 2000 along a thin stretch of beach separating the Gulf of Mexico from the Mobile Canal.
CWPPRA	West Belle Pass Headland Restoration	TE-23	SP	USACE	LAFOURCHE	474	N/A	1999	\$6,826,754	The project reduces the encroachment of Timbalier Bay into the marshes on the west side of Bayou Lafourche with the use of dedicated dredge materials to create 104 acres of marsh on the west side of Bell Pass. A water control structure was placed in the Evans Canal, and plugs on other canals.
CWPPRA	Isles Derniers Restoration Trinity Island	TE-24	BH, MC	EPA	TERREBONNE	776	N/A	1999	\$0,774,974	The project objectives are to restore the marshes west of Lake Chapeau, re-establish the natural drainage patterns within the Lake Chapeau area, and protect the lower Terrebonne estuary.
CWPPRA	East Imbaler Island Sediment Restoration	TE-25	BH	NMFS	TERREBONNE	1913	N/A	2001	\$3,770,721	The objective of this project is to strengthen and thus increase the life expectancy of East Timbalier Island. The project called for the mining of 2.7 million cubic yards of sediment and placement of the material in three embayments along the laward shore of East Timbalier Island. The project also included aerial seeding of the dune platform, installation of sand fencing, and dune vegetation plantings.
CWPPRA	Lake Chapeau Sediment Input and Hydrologic Restoration, Point Au Fer Island	TE-26	MC	NMFS	TERREBONNE	509	N/A	1999	\$6,810,133	The objectives of this project are to restore the marshes west of Lake Chapeau, re-establish the natural drainage patterns within the Lake Chapeau area, and protect the lower Terrebonne estuary. The project created 523 acres of back island marsh and filling in the breach at Coue Nouvelle (134 acres). The initial vegetation planting with smooth cordgrass (Spartina alterniflora) on the bay side of the canal was completed in July 1998, and additional vegetation seedling planting was carried out in Spring 2000.
CWPPRA	Brady Canal Hydrologic Restoration	TE-28	HR	NRCS	TERREBONNE	297	N/A	2000	\$7,593,752	The objective of this project is to maintain the fragile, highly-fragmented transitional marshes between the fresh and estuarine zones by enhancing freshwater sediment and nutrient delivery into the area.
CWPPRA	Raccoon Island Breakwaters Demonstration	TE-29	BH	NRCS	TERREBONNE	N/A	N/A	1997	\$1,795,388	This project protects the newly-established beaches and wetlands of Raccoon Island and protect back barrier and mainland marshes with six segmented breakwaters.

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRAs Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Levee Improved	Construction Completion	Total Budget	Project Description	Planning Unit
CWPPRA	East Timbalier Island Sediment Restoration	TE-30	BH	NMFS	TERRERBONNE	215	N/A	2000	\$7,600,150	The project goal is to strengthen and increase the life expectancy of East Timbalier Island by placing dredged material along its landward shoreline. Additional rock has been placed on the existing breakwater in front of the island, which will help protect the created area from erosion.	3A
CWPPRA	Flotant Marsh Fencing Demonstration (Deauthorized)	TE-31	SP	NRCS	TERRERBONNE	N/A	N/A	Deauthorized	\$106,960	The purpose of this demonstration project was to determine the effectiveness of different fencing techniques used to conserve and restore floating marshes. There was difficulty in locating an appropriate site for demonstration and in addressing engineering constraints. The restoration techniques that were originally suggested for this project were not feasible. The project was officially deauthorized by the CWPPRA Task Force in 2001.	3A
CWPPRA	North Lake Boudeaux Basin Freshwater Introduction and Hydrologic Management	TE-32A	FD	USFWS	TERRERBONNE	603	N/A	Pending	\$26,875,955	The purpose of this project is to introduce freshwater flow from north-western to south-eastern sub-project areas coupled with protection through a gated channel.	3A
CWPPRA	Bayou Beauf Pump Station (Deauthorized)	TE-33	HR	EPA	TERRERBONNE	N/A	N/A	Deauthorized	\$3,452	The purpose of this project was to link the wetlands protection/restoration objectives of the CWPPRA with flood protection and navigation needs generally covered by WRDA. The project component consisted of implementing a long-term water delivery strategy from Achafalaya River to Terrebonne wetlands. The project was officially deauthorized by the CWPPRA Task Force in 1988.	3A
CWPPRA	Penchant Basin Natural Resources Plan, Increment 1	TE-34	FD, HR, SP	NRCS	TERRERBONNE	675	N/A	2011	\$17,628,814	The objective of this project is to driven freshwater flow from north-western to south-eastern basin in Terrebonne Parish. Although the project would have benefited .34 acres at a cost of \$6,384,000, the cost of the project was estimated to be considerably higher than originally planned, making it economically unjustifyable. The project was officially deauthorized by the CWPPRA Task Force in 1998.	3B
CWPPRA	Marsh Creation, East of the Atchafalaya River - Avoca Island (Deauthorized)	TE-35	MC	USACE	ST MARY	434	N/A	Deauthorized	\$66,669	The project consisted of the beneficial use of dredged material from the "Crew Boat Cruise" and placing it in the Avoca Island area. Measures to reduce inundation of fragile marsh areas in overall Parishes Basin in Terrebonne Parish.	3B
CWPPRA	Thin Mat Floating Marsh Enhancement Demonstration	TE-36	MC	NRCS	TERRERBONNE	N/A	N/A	2000	\$53,8101	The objective of this project is to induce the development of thick-mat, continuously floating marsh from a thin-mat floatant using various combinations of reagents including fertilization, herbivory reduction, transplanting healthy, thick-mat marsh plugs into the thin-mat floatant. Project monitoring is intended to determine the effects of water movement and sediment availability on these marshes.	3B
CWPPRA	New Cut Dune and Marsh Restoration	TE-37	BH, MC	EPA	TERRERBONNE	386	N/A	2008	\$12,869,325	The objective of this project was to close the breach between East and Trinity Islands that was originally created by Hurricane Carmen (1974) and subsequently enlarged by Hurricane Juan (1985) and Hurricane Andrew (1992). The project involved the creation of barrier island dunes and marsh habitat and strengthening the structural integrity of the eastern Isles Dunes by restoring the littoral drift and adding sediment into the near-shore system.	3A
CWPPRA	South Lake Decade Freshwater Introduction	TE-39	SP	NRCS	TERRERBONNE	202	N/A	2011	\$5,223,606	This project involves the construction of a water control structure on the southern bank of Lake DeCode. The structure increases the amount of Atchafalaya River water and sediment introduced into the marshes south of the lake. In addition, shoreline protection was implemented adjacent to the proposed structure and a weir in Ligerous Bayou was removed.	3A
CWPPRA	Timbalier Island Dune and Marsh Restoration	TE-40	BH, MC	EPA	TERRERBONNE	663	N/A	2004	\$16,662,199	Timbalier Island is migrating rapidly to the west/northwest; therefore, the western end of Timbalier Island is under threat of being lost. The objective of this project is to restore the eastern end of Timbalier Island by the direct creation of beach, dunes, and marsh.	3A
CWPPRA	Mandalay Bank Protection Demonstration	TE-41	SP	USFWS	TERRERBONNE	N/A	N/A	2003	\$17,732,498	This demonstration project intended to develop new techniques for protecting and restoring organic soils, which can be easily eroded by spit-building processes at the expense of erosion along the eastern end. The objective of this project is to restore the eastern end of Inlet banks and breakthroughs were treated to determine the cost-effectiveness of demonstrated approaches. The project allows the evaluation of several low-cost solutions for restoring habitat in blowout areas and preventing bank erosion.	3A
CWPPRA	Move Existing Atchafalaya Water to Central Terrebonne (Transferred)	TE-42	HR	USFWS	ST MARY	N/A	N/A	Transferred	N/A	This project is intended to reduce marsh loss through the improved distribution of excess freshwater seasonally available in the Gulf Intracoastal Waterway (GIWW). The project will benefit deteriorating marshes in central and/or eastern portions of the Terrebonne Basin. This project was transferred to the ICA or CAC.	3A
CWPPRA	CWPPRA Bank Restoration of Critical Areas in Terrebonne (Transferred)	TE-43	SP	NRCS	TERRERBONNE	345	N/A	2014	\$13,022,245	The project objective is to design, critique lengths of deteriorated channel banks and stabilize/jamor selected critical lengths of deteriorated channel banks with hard chronic stabilization materials. A portion of this project was constructed using CAP 2007 funds and the remainder of the project was constituted under CWPPRA.	3A
CWPPRA	North Lake Merchant Landbridge Restoration	TE-44	SP, MC	USFWS	TERRERBONNE	604	N/A	2009	\$39,004,428	The project is intended to help maintain and restore the landbridge (Lake Merchant) non-tidal shoreline and the Small Bayou La Pointe Ridge, which provides a hydrologic barrier between brackish and low-salinity habitats. Project features include a marsh creation, the planting of smooth cordgrass (Spartina alterniflora) on the shoreline, the construction of various plugs, and repairing a fixed-crest wier along Bayou La Paccourci.	3A
CWPPRA	Terrebonne Bay Shore Protection Demonstration	TE-45	SP	USFWS	TERRERBONNE	0	N/A	2007	\$2,718,768	This project is intended to evaluate several different shoreline protection methods, including concrete mats, artificial oyster reefs and A-jacks.	3A
CWPPRA	West Lake Boureaux Shoreline Protection and Marsh Creation	TE-46	SP	USFWS	TERRERBONNE	145	N/A	2003	\$17,893,813	The purpose of this project is to create and nourish about 200 acres of marsh along the western shoreline of Lake Boureaux to protect the shoreline from erosion due to direct exposure to lake wave energy and to restore interior marsh lost to subsidence and saltwater intrusion.	3A
CWPPRA	Ship Shoal Whiskey West Flank Restoration (Inactive)	TE-47	BH	EPA	TERRERBONNE	500	N/A	Inactive	\$1,569,810	The objective of this project is to rebuild dunes and a marsh platform on the west flank of Whiskey Island through the deposition of dredged material transported from Ship Shoal. This project would provide a barrier to reduce wave and tidal energy thereby protecting marine shoreline from continued erosion. The project was designated as inactive by the CWPPRA Task Force.	3A
CWPPRA	Raccoon Island Shoreline Protection and Marsh Creation	TE-48	BH, MC	NRCS	TERRERBONNE	16	N/A	2007, 2013	\$2,1364,793	The purpose of this project is to protect the existing southern shoreline of the island by constructing 8 more rock breakwaters. Phase B	3A
CWPPRA	Avoca Island Diversen and Land Building (Deauthorized)	TE-49	FD, MC	USACE	ST MARY	N/A	N/A	Deauthorized	\$19,157,200	The project was subsequently deauthorized by the CWPPRA Task Force. The project had a small diversion from Bayou Shaffer into Avoca Lake paired with marsh creation through dedicated dredging. Features included dredged sediment from the Gulf side beach above.	3A
CWPPRA	Whiskey Island Back Barrier Marsh Creation	TE-50	BH	EPA	TERRERBONNE	270	N/A	2010	\$30,414,083	The goal of this project is to recreate a back barrier marsh platform on which the barrier island can migrate in order to increase the longevity of the previously restored and natural portions of the island. Heavy construction was complete in fall of 2009. Project linear feet of sand dune on the Gulf side beach above.	3A
CWPPRA	Madison Bay Marsh Creation and Teracing	TE-51	MC, TE	NMFS	TERRERBONNE	1019	N/A	Pending	\$39,821,438	The goals of this project are to: 1) create and nourish marsh and associated edge habitat and to promote conditions conducive to the growth of subtidal aquatic vegetation; 2) proposed terraces will reduce the wave erosion of existing marshes along the fringes of Madison Bay. The project would benefit approximately .019 acres of fresh marsh and open water over the 20-year project life.	3A
CWPPRA	West Baile Pass Barrier Headland Rehabilitation	TE-52	BH	NMFS	LAFOURCHE	389	N/A	2012	\$39,422,093	This project involves the reestablishment of the West Baile headland by rebuilding a large portion of the beach, dune, and back barrier marsh that once existed. Approximately 9,300 feet of beach and dune were rebuilt.	3A
CWPPRA	Enhancement of Barrier Island Vegetation Demo	TE-53	VP	EPA	TERRERBONNE	N/A	N/A	2011	\$9,19,264	The goal of this project is to test several technologies or products to enhance the establishment and growth of key barrier island and salt marsh vegetation of those two water bodies. The project focuses specifically on enhancing the establishment and growth of transplants of salt-dune vegetation (bitter panicum (Panicum amarum) and sea oats (Uniola paniculata)) and marsh vegetation (smooth cordgrass (Spartina alterniflora) and black mangrove (Avicennia germinans)).	3A, 3B
CWPPRA	Central Terrebonne Freshwater Enhancement	TE-66	MC, HR	NRCS	TERRERBONNE	456	N/A	Pending	\$17,890,120	The project will establish historic hydrologic and salinity conditions by reducing the artificial intrusion of Gulf marine waters via the Grand Pass into the central Terrebonne marshes while enhancing the influence of the Atchafalaya River waters into the area.	3A
CWPPRA	Lost Lake Marsh Creation and Hydrologic Restoration	TE-72	HR, MC	USFWS	TERRERBONNE	749	N/A	Pending	\$35,873,728	Project goals include 1) restore an important feature of structural framework between Lake Paige and Bayou Decade to prevent the coalescence of those two water bodies; 2) increase the delivery of fresh water, sediments, and nutrients into marshes north and west of Lost Lake; 3) reduce fetch in open water areas via construction of a terrace field.	3A, 3B
CWPPRA	Terrebonne Bay Marsh Creation - Nourishment	TE-83	MC	USFWS	TERRERBONNE	353	N/A	Pending	\$28,664,401	Project goals are to create 365 acres of intertidal marsh in shallow water and nourish 239 acres of fragmented marsh within the project area, reducing water exchange between Terrebonne Bay and interior lakes during tidal and storm events and to reduce erosion along 16,000 ft of the northern Terrebonne Bay shoreline.	3A
CWPPRA	North Cutoff Lake Marsh Creation & Island Road Bay Marsh Nourishment	TE-117	MC	NOAA	TERRERBONNE	312	N/A	Pending	\$30,325,019	Segments will be hydraulically dredged from Cutoff Lake and pumped via pipeline to create approximately 415 acres of marsh habitat at and nourish an additional 56 acres of marsh habitat.	3A
CWPPRA									\$40,435,267	The proposed project's primary feature is 364 acres of created saline marsh and 19 acres of nourished saline marsh adjacent to Island Road. Sediment will be hydraulically pumped from a borrow source near Lake Elicity. Half of the newly constructed marsh (182 acres) will be planted following construction to stabilize the platform and reduce time for full vegetation. The project would result in an approximate net increase of 312 acres over the 20-year project life.	3A

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Construction Completion	Total Budget	Project Description	
									Miles of Improved Levee	
CWP/PPRA	Vermilion River Cutoff Bank Protection	TV-03	SP	USACE	VERMILION	202	N/A	\$2,047,479	The project design includes protecting the east side of the Vermilion River Cutoff with rock to prevent further erosion; hardening the points on existing land bridges on the west bank of the Cutoff with rock and constructing sediment trapping fences on the Vermilion Bay side to stabilize and protect the land bridge from wave action in the Bay.	3B
CWP/PPRA	Cole Branch Hydologic Restoration	TV-04	HR	NRCS	ST MARY	2223	N/A	\$10,093,902	The primary objective of the project is to reduce future shoreline loss from wave erosion, reduce excessive tidal fluctuations and rapid tidal exchange to prevent scouring of interior marsh, develop a hydrologic regime conducive to sediment and nutrient deposition, and to re-establish vegetation in eroded areas.	3B
CWP/PPRA	Boston Canal/Vermilion Bay Bank Protection	TV-09	SP	NRCS	VERMILION	378	N/A	\$1,043,748	The project involves stabilizing 15 miles of Vermilion Bay shoreline and preventing further regression of the Boston Canal banks. A strip of Vermilion Bay shoreline approximately 25 feet wide by 15 miles was planted with single stems of Spartina alterniflora at 3' foot intervals.	3B
CWP/PPRA	Freshwater Bayou Bank Stabilization - Belle Isle Canal to Lock (Inletive)	TV-11B	SP	USACE	VERMILION	N/A	Inactive	\$1,101,736	The project was intended to construct a rock-dike to protect the east shoreline of Freshwater Bayou Canal. The project was subsequently designated as inactive by the CWP/PPRA Task Force.	3B
CWP/PPRA	Little Vermilion Bay Sediment Trapping	TV-12	TE	NMFS	VERMILION, IBERIA	441	N/A	\$86,030	This project is designed to optimize the retention of sediment from the Atchafalaya River to create new marsh areas in Little Vermilion Bay. Dredged material was placed to create emergent marsh, thereby protecting the existing shoreline from wind-induced wave erosion.	3B
CWP/PPRA	Oaks/Avery Canal Hydrologic Restoration, Increment 1	TV-13A	HR	NRCS	VERMILION, IBERIA	160	N/A	\$2,925,216	The objective of the project is to improve hydrology, reduce tidal fluctuation to minimize marsh loss, and provide protection to critically eroding bankline and shoreline area.	3B
CWP/PPRA	Marsh Island Hydrologic Restoration	TV-14	HR	USACE	IERIA	408	N/A	\$5,143,323	The objective of the project is to stabilize the northeastern shoreline of Marsh Island, including the northern shoreline of Lake Sand and Marsh Island, protection of the historic canal at the northeast end of the canal, and protection of the northeast shoreline with rock, and isolation of Lake Sand from Vermilion Bay with a rock dike.	3B
CWP/PPRA	Sediment Trapping at "The Jaws"	TV-15	TE, VP	NMFS	ST MARY	1999	N/A	\$1,653,792	The objective of the project is to stabilize the northeastern shoreline of Marsh Island including the northern portion of the coastline that have already eroded away. The project included construction of five plugs in oil and gas canals at the northeast end of the canal to help to reduce the historic canal.	3B
CWP/PPRA	Cheniere Au Tigre Sediment Trapping Demonstration	TV-16	SNIT	NRCS	VERMILION	N/A	2001	\$624,899	The objective of the project is to field test a conceptual device designed to trap sediment from the gulf tides, stabilize the on-going erosion on Cheniere Au Tigre and build up portions of the coastline that have already eroded away.	3B
CWP/PPRA	Lake Portage Land Bridge	TV-17	SP	NRCS	VERMILION	1496	N/A	\$1,181,128	The objective of this project is to prevent the shoreline south of Lake Portage from breaching and creating another pass from Vermilion Bay to the Gulf. The project consists of backfilling a canal and amoring the beach with rock.	3B
CWP/PPRA	Four Mile Canal Termiticing and Sediment Trapping	TV-18	TE	NMFS	IERIA	52	N/A	\$2,667,186	This project includes construction and planting of terraces with smooth cordgrass (Spartina alterniflora) within Little White Lakes and Little Vermilion Bay along Four Mile Canal, to abate wave-induced shoreline erosion and facilitate sedimentation in the open water areas between the berences.	3B
CWP/PPRA	Weeks Bay Marsh Creation and Shore Protection/ Commercial Canal Freshwater Redirection (Transferred)	TV-19	SP	USACE	IERIA	N/A	N/A	\$30,227	The goal of the project is to create marsh to restore Anhinga Bridge separating Weeks Bay and GIWW. In 2013, the CWP/PPRA Task Force transferred implementation of the project to parish stakeholders.	3B
CWP/PPRA	Bayou Sale Shoreline Protection (Deauthorized)	TV-20	SP	NRCS	ST MARY	131	N/A	\$32,103,020	The goal of the project was to protect an eroding shoreline with appprox 35,776 feet of rock dike shoreline protection. The project was deauthorized by the CWP/PPRA Task Force in 2014.	3B
CWP/PPRA	East Marsh Island Marsh Creation	TV-21	MC	NRCS	IERIA	1159	N/A	\$21,215,936	The objective of the project was to create approximately 362 acres of sustainable marsh. The majority of the project area has been converted to open water, primarily because of Hurricane Lili (2002). The use of approximately \$4 million in unused construction funds, over 500 acres of additional marsh was created/reinforced. The sediment for marsh creation was dredged from East Cole Blanche Bay and pumped to a maximum of 6 miles.	3B
CWP/PPRA	Coile Bayou Marsh Creation	TV-23	MC	NMFS	VERMILION	398	N/A	\$27,881,223	This coastal vegetative planting project is for erosion control and habitat restoration in the Lost Lake area of southwestern Terrebonne Parish. The project consists of creating/nourishing marsh habitat and increasing freshwater and sediment inflow into interior wetlands by improving project area hydrology.	3B
FEDERAL	Lake Pontchartrain Hurricane Mitigation Project	HPL-MIT	SP	USACE	ST JOHN THE BAPTIST	600	N/A	Deauthorized	The project was to protect the shoreline in Lake Pontchartrain parallel to a five-mile reach of the Lake Pontchartrain Wildlife Management Area. The project specifically mitigated for damages resulting from construction of the Lake Pontchartrain Hurricane Protection project.	1
FEDERAL	MRGO Ecosystem Restoration	PO-85	VP, FD, MM, SP, MC	USACE	ST BERNARD, ORLEANS	53700	N/A	2010	\$21,215,936 The project area has been converted to open water, primarily because of Hurricane Lili (2002). The use of approximately \$4 million in unused construction funds, over 500 acres of additional marsh was created/reinforced. The sediment for marsh creation was dredged from East Cole Blanche Bay and pumped to a maximum of 6 miles.	3B
FEDERAL	Lost Lake Vegetation Project	TE-82	VP	USFWF	TERREBONNE	N/A	N/A	Pending	\$2,222,892 This coastal vegetative planting project is for erosion control and habitat restoration in the Lost Lake area of southwestern Terrebonne Parish.	3A
FEMA	Houma Navigation Canal Levee Maintenance	DSR-81567	SP	FEMA	TERREBONNE	4000	N/A	1995	\$21,600,000 This FEMA project involved the repair of segments of the western bank of the Houma Navigation Canal damaged by Hurricane Andrew in 1992.	3A
FEMA	Wine Island	DSR-81568	DM	FEMA	TERREBONNE	25	N/A	1995	\$25,575,750 This FEMA project was a cooperative venture with the USACE in the beneficial use of dredged material from a dredged lorma Navigation Canal maintenance dredging project. The island was repanted to pre-Hurricane Andrew condition and planted with vegetation to stabilize the sediment.	3A
FEMA	Timblier Island Repairs	DSR-81569	BH	FEMA	TERREBONNE	70	N/A	1996	\$55,165,555 This FEMA project closed a major breach created by Hurricane Andrew and provided a 300-foot-wide elevated marsh platform to the island. Vegetation was last planted in 2006.	3A
FEMA	East Island Repair Protection	DSR-81560	DM	FEMA	TERREBONNE	25	N/A	1996	\$633,179 This FEMA project constructed an elevated marsh platform in an area of a Terrebonne Parish project destroyed by Hurricane Andrew in 1992. Vegetation was also planted to stabilize the sand.	3A
FEMA	LaBranch Wetlands	DSR-81768	SP	FEMA	ST CHARLES	N/A	N/A	2000	\$4,315 A 700-foot section of a Christmas tree brush fence was repaired. This project was damaged by Hurricane Georges, Hurricane Earl and Tropical Storm Francis in 1998.	3A
FEMA	Timblier Island	DSR-81764	BH	FEMA	TERREBONNE	N/A	N/A	2000	\$18,134 This FEMA project repaired sand fencing on Timblier Island that was destroyed during a series of tropical storms and hurricanes in the fall of 1998.	3A
FEMA	Faigout Canal	DSR-81765	SP	FEMA	TERREBONNE	N/A	N/A	2000	\$10,761 This FEMA project replaced lapp gates on water control structures damaged during Tropical Storm Georges in the fall of 1998.	3A
FEMA	East Island	DSR-81766	VP	FEMA	TERREBONNE	N/A	N/A	2000	The installation of the new lapp gates culverts was completed by a Terrebonne Parish Consolidated Government.	3A
FEMA	Isle Demeries (Whiskey Island)	DSR-81767	VP	FEMA	TERREBONNE	1259	N/A	2000	\$168,113 This FEMA project involved the planting of marsh vegetation on the dune and Lake Pelté shoreline of East Island. This area is part of a CWP/PPRA project damaged by a series of tropical storms and hurricanes in the fall of 1998. A total of 1,280 square cordgrass (Spartina alterniflora), 500 black mangrove (Avicennia germinans), and 6,147 roseau cane (Phragmites australis) plants were planted in April 2000.	3A
FEMA	Marsh Island Repairs	PW-1646	MM	FEMA	IERIA	N/A	N/A	2005	\$581,565 This FEMA project involved the installation of sand fencing and the planting of vegetation to repair areas of Whiskey Island damaged by tropical storms and hurricanes during the fall of 1998. This area is part of a CWP/PPRA project area and CWP/PPRA funds were comanded with the FEMA funds for repairs.	3A
FEMA	Cole Branch Repairs	PW-1906	HR	FEMA	ST MARY	N/A	N/A	2005	\$885,861 This FEMA project consisted of repairs to areas of stone paving, stone dikes, and minor repair of navigation aids on the Marsh Island Hydrologic Restoration (V-14) project damaged during Hurricane Lili in 2002.	3B
FEMA	Cameron Creek Structures	PW-4257	HR	FEMA	CAMERON	N/A	N/A	2007	\$64,092 This FEMA project consisted of repairs to areas of stone paving, stone dikes, and minor repair of navigation aids on the Cole Branch Hydrologic Restoration (TV-04) project damaged during Hurricane Lili in 2002. The project also included minor maintenance work paid for by CWP/PPRA.	3B
FEMA	Holy Beach Sand Fencing	PW-4403	SP	FEMA	CAMERON	N/A	N/A	2003	\$25,700 This FEMA project consists of repairs to five structures of the Cameron Creek Maintenance (CS-04a) project that were damaged by Hurricane Rita in 2005. These structures are located at Grand, Pecon, Lambert, No Name, and Mangrove Bayous.	4
FEMA	Hopedale Hydrological Structure	PW-8743	HR	FEMA	ST BERNARD	N/A	N/A	2007	\$218,473 This FEMA project consists of the replacement of 46 linear feet of sand fencing on the Hopedale Hydrologic Restoration (PO-24) project that was destroyed by Hurricane Katrina in 2005. Repairs were made to damaged fencing, railings, and displaced riprap, and a lost portable hydraulic actuator is being replaced.	4
FEMA									\$64,900 This FEMA project consists of repairs to the water control structure of the Hopedale Hydrologic Restoration (PO-24) project that was damaged by Hurricane Katrina in 2005. Repairs were made to damaged fencing, railings, and displaced riprap, and a lost portable hydraulic actuator is being replaced.	1

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Levee Improved	Construction Completion	Total Budget	Project Description		Planning Unit
										Levee	Levee	
FEMA	Lake Pontchartrain Debris Removal	N/A	N/A	N/A	JEFFERSON, ORLEANS, ST CHARLES, ST JOHN THE BAPTIST, ST TAMMANY,	N/A	N/A	2010	\$10,000,000	The goal of this project was to remove debris from approximately 758 square miles of Lake Pontchartrain.	1	
FEMA	Montegut Wetlands	PW-1728	MM	FEMA	TERREBONNE	N/A	N/A	2005	\$1,093,962	This FEMA project repaired damage to the Montegut Wetland (TE-01) project that occurred during Hurricane Ida in 2002. The project consisted of reworking and reconstructing 17,000 linear feet of an existing earthen levee using offsite borrow material.	3A	
HSDRRS	West Bank and Vicinity	BA-66	HP	USACE	ST CHARLES, ORLEANS, JEFFERSON, PLAQUEMINES	N/A	71	Pending	\$3,150,000,000	The project is currently designed to provide 100 Year protection levels to the project area through the construction of levees to the 2011 protection levels and "V-Walls and other structures to the 205+ protection levels.	2	
HSDRRS	New Orleans to Venice	BA-67	HP	USACE	ST CHARLES, ORLEANS, JEFFERSON, PLAQUEMINES	N/A	58	Pending	\$1,301,523,760	The NOV project consists of 24 areas of work covered by projects NOV-1.2, NOV-NFW-4 to 6, NE-Q2, and Taskforce System. This NOV project includes the section of the P-Plaquemines Parish Hurricane Protection System.	1,2	
HSDRRS	Grand Isle and Vicinity	BA-73	SP	USACE	JEFFERSON	N/A	Not Available	Pending	\$25,000,000	The Grand Isle and Vicinity Hurricane Protection Project consists of a 7.5 mile vegetated sand dune extending the length of Grand Isle's Gulf shore, a 60' to stabilize the western end of the Island at Caminard Pass, and an offshore breakwater system.	2	
HSDRRS	Storm-Proofing of Interior Pumping Stations	BA-74	FP	USACE	JEFFERSON, ORLEANS	N/A	N/A	Pending	\$30,000,000	This project involves the installation of various improvement features to the interior pump stations of Orleans and Jefferson Parish under the Hurricane and Storm Damage Risk Reduction System (HSDRRS).	2	
HSDRRS	HSDRRS Mitigation- WBV	BA-109	MC	USACE	JEFFERSON, LAFOURCHE	1318	N/A	Pending	\$126,000,000	This USACE project involves the implementation of various restoration measures to mitigate wetland impacts associated with the construction of the West Bank and Vicinity (WBV) project.	2, 3A	
HSDRRS	Risk Reduction-Barrataria Basin Landbridge	BA-148	MC, HP	USACE	JEFFERSON	223	N/A	Pending	\$10,100,000	This project is being led by USACE and is 100% federally funded (funded with \$10.1 Million allocated by the U.S. 4th Supplemental Appropriations as a Hurricane Risk Reduction project). It provides for about 1,130 acres of marsh creation and 122 acres of marsh nourishment on the south shore of the Pen.	2	
HSDRRS	Previously Authorized Mitigation WBV	BA-154	MM, VP, PP	USACE	JEFFERSON, ST. CHARLES	1130	N/A	Pending	\$11,000,000	This project is being led by USACE and is 100% federally funded (funded with approximately \$79 Million allocated). It provides for about 1,130 acres of mitigation, including: (1) acquisition, improvement, and management of approximately 228 acres of BLH wetland habitat adjacent to Bayou Argent State Park; (2) acquisition, improvement, and management of approximately 970 acres of high value wood wetlands in St. Charles Parish; and (3) acquisition, improvement, and management of approximately 360 acres of high quality wooded lands in St. Charles Parish.	2	
HSDRRS	Plaquemines TFU Mitigation - Braithwaite to Scarsdale - Big Mar	BA-156	MC	USACE	PLAQUEMINES	24	N/A	Pending	\$2,800,000	This project is being led by USACE and is 100% federally funded (funded with approximately \$2.8 Million allocated). It provides for the creation of approximately 24 acres of marsh. Additionally, Plaquemines Parish will be combining a neighboring local project of 16 acres of marsh creation to this project with supplemental funding for a total of 40 acres. This project is being led by USACE and is 100% federally funded (funded with approximately \$14.5 Million allocated). It provides for about 180 acres of mitigation, which includes approximately 30 acres of BLH wetland combined, 140 acres of intermediate marsh, .70 acres of freshwater marsh, .76 acres of brackish marsh, and 280 acres of saline marsh.	1	
HSDRRS	New Orleans to Venice Mitigation - Plaquemines Non-Federal	BA-158	MC	USACE	PLAQUEMINES	342	N/A	Pending	\$14,500,000	This project is being led by USACE and is 100% federally funded (funded with approximately 50 acres of BLH wetland combined, 50 acres of swamp, 60 acres of freshwater marsh, and 20 acres of brackish marsh).	2, 1	
HSDRRS	New Orleans to Venice Mitigation - Federal	BA-159	MC	USACE	PLAQUEMINES	410	N/A	Pending	\$30,000,000	This project is being led by USACE and is 100% federally funded (funded with approximately 30 acres of BLH wetland combined, 140 acres of intermediate marsh, .70 acres of marsh creation).	2, 1	
HSDRRS	Risk Reduction Via Modification to the Caernarvon Freshwater Diversion	BS-03B	FD, SD, HP	USACE	PLAQUEMINES	65	N/A	Pending/On Hold	\$10,100,000	This project is being led by USACE and is 100% federally funded (funded with 1.1 Million allocated by the U.S. 4th Supplemental Appropriations as a Hurricane Risk Reduction project). It provides for redirecting water from the Caernarvon Diversion into the 40-Ap Canal to enhance the movement of fresh sediment-laden water into the marsh north of Lake Verv in order to halt and reverse marsh deterioration. This project was originally included as a shunt under CWRPRA BS-16 but removed to allow USACE to fund it as a marsh creation project.	1	
HSDRRS	Lake Pontchartrain & Vicinity - Lake Borgne Surge Barrier LPV-IHCN-02	PO-55	HP	USACE	ST BERNARD, ORLEANS	2	2013		\$1,134,000,000	This project involves the construction of a Hurricane Surge Barrier across the tip of Lake Borgne connecting the MRGO levees south of Bayou Benvenue with the GWWB levees East of Michoud Canal with floodgates at Bayou Benvenue and GIWW.	1	
HSDRRS	SELA	PO-57	OT	USACE	JEFFERSON, ORLEANS	N/A	N/A	Pending	\$1,170,974,586	This project consists of drainage and pump station projects within Jefferson Parish and Orleans Parish, on both the east bank and west bank of the Mississippi River.	1,2	
HSDRRS	Permanent Closure of Canals and Pumps	PO-60	HP	USACE	JEFFERSON	0.34	0.34	Pending	\$64,180,000	This project, authorized under Public Law 09-234, involves the design and construction of a permanent protection system for the outlet canals along 17th Street, Orleans Avenue, and London Avenue and initial pumps and closure structures at or near the waterfront.	1	
HSDRRS	West Shore Lake Pontchartrain	PO-62	HP	USACE	ST JOHN THE BAPTIST, ST CHARLES, ST JAMES, ASCENSION	N/A	27	Pending	\$888,582,586	This project involves the assessment of hurricane and storm reduction measures in a study area bounded by the Bonnet Carré Spillway to the east, The Mississippi River to the south, Lakes Pontchartrain and Maurepas to the north, and the St. James Parish/Ascension Parish line to the west.	1	
HSDRRS	Lake Pontchartrain and Vicinity PO-63	PO-63	HP	USACE	ST CHARLES, JEFFERSON	N/A	128	2010	\$3,852,000,000	Lake Pontchartrain and Vicinity (LPV) is the hurricane protection program that involves approximately 30 hurricane protection projects in East Jefferson and St. Charles Parishes.	1	
HSDRRS	Lake Pontchartrain & Vicinity, Seabrook Lock LPV-HNC-01	PO-64	HP	USACE	ORLEANS	0.5	2012		\$157,156,414	This project consists of a gated closure structure across the Industrial Canal approximately 500 ft South of the Ted Hickey Bridge at Lake Pontchartrain to work in conjunction with the I-HNC Bonghe Surge Barrier.	1	
HSDRRS	HSDRS Mitigation- LPV	PO-121	MC	USACE	ST TAMMANY, ORLEANS	1089	N/A	Pending	\$6,000,000	This USACE project involves the implementation of various restoration measures to mitigate wetland impacts associated with the construction of the Lake Pontchartrain and Vicinity (LPV) project.	1	
HSDRRS	LPV Task Force Guardian Mitigation- Bayou Sauvage	PO-145	MM, VP	USACE	ORLEANS	58	N/A	Pending	\$78,000	This project is being led by USACE and is 100% federally funded (funded with approximately \$2 Million allocated). This project is mitigating approximately 147 acres due to emergency levee work that utilized 2 borrow pits of about 57 acres. It provides for the elimination of non-native trees with spraying and mechanical clearing, and then the replanting of up to 89,000 trees and shrubs of native species, including buttonwoods, pecans, cypressresses, and oaks.	1	
HSDRRS	Previously Authorized Mitigation LPV- Marchac	PO-146	MC, SP	USACE	ST JOHN THE BAPTIST	1329	N/A	Pending	\$22,985,956	This project is being led by USACE and is 100% federally funded (funded with approximately \$21.3 Million allocated). It provides for containment dikes, will rock and fill areas with dredge material to match the CPRA Tulie Cove project success). The project is intended to create marsh and reduce erosion.	1	
LOUISIANA COASTAL AREA	LCA Small Bayou Lafourche Reinstitution	BA-70	FD	USACE	ASSUMPTION, LAFOURCHE	1089	N/A	Pending/On Hold	\$133,500,000	The project will use a small dike (less than 500 cfs) to reintroduce flow from the Mississippi River into Bayou Lafourche. Project goals include providing freshwater, sediment and nutrients needed to reduce salinity, stimulating plant productivity, and reducing wetland loss between Bayous Lafourche and Terrebonne. Funds from the budget of 2008 will be used for the state's cost share.	3A	
LOUISIANA COASTAL AREA	LCA Medium Diversion with Dedicated Dredging at Myrtle Grove	BA-71	FD	USACE	PLAQUEMINES	N/A	N/A	Pending/On Hold	\$278,300,000	Authorized construction cost and funds from the budget of 2007/legislation requirement. Construction cost and 1/terebonne. Funds from the budget of 2008 will be used for the state's cost share.	2	
LOUISIANA COASTAL AREA	LCA Modification of Davis Pond	BA-72	FD	USACE	ST CHARLES, JEFFERSON, PLAQUEMINES, LAFOURCHE	N/A	N/A	Pending/On Hold	\$88,277,985	This modification project is authorized to study and design the modification of the structure and/or outfall of the diversion to increase wetland restoration outputs within the Barataria Basin.	2	

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Levee Improved	Construction Completion	Total Budget	Project Description		Planning Unit
										Levee	Impacted	
LOUISIANA COASTAL AREA COASTAL AREA	LCA Modification of Caernavon Diversion	BS-19	FD	USACE	ST BERNARD, PLAQUEMINES	N/A	N/A	Pending/On Hold	\$21,000,000	This modification project is authorized to study and design the modification of the diversion structure and/or outfall of the diversion to increase wetland restoration outputs south of Caernavon, west of the Mississippi River.	1	
LOUISIANA COASTAL AREA COASTAL AREA	LCA Medium Diversion at White's Ditch - 2007 Shoreline	BS-20	FD	USACE	JEFFERSON, PLAQUEMINES, LAFOURCHE COASTWIDE	N/A	N/A	Pending/On Hold	\$126,686,400	A medium diversion from the Mississippi River into the central River aux Chenes area using a controlled structure to provide additional freshwater, nutrients, and fine sediment to the area between the Mississippi River and River aux Chenes ridges, to provide additional sediment to the area between the Mississippi River and River aux Chenes ridges, and to provide beach/dune restoration and marsh creation on Caminada Headlands and Shell Island.	1	
LOUISIANA COASTAL AREA COASTAL AREA	LCA Basin Barrier Study	LA-10	MC/BH	USACE	JEFFERSON, PLAQUEMINES, LAFOURCHE COASTWIDE	N/A	N/A	Pending/On Hold	\$33,900,000	The purpose of this project is to provide beach/dune restoration and marsh creation on Caminada Headlands and Shell Island.	2	
LOUISIANA COASTAL AREA COASTAL AREA	LCA Beneficial Use Feasibility Study	LA-19	DM	USACE	PLAQUEMINES	N/A	N/A	Pending/On Hold	\$100,000,000	This Feasibility Study will examine increased beneficial use of dredged material from Federally authorized navigation channels. This project involves the development of a strategic framework for feasibility evaluation of improved management of fresh water, nutrients, and sediment resources of the Lower Mississippi River, from the Old River Control Structure to Head of Passes, to better sustain a Deltaic Plain.	COASTWIDE	
LOUISIANA COASTAL AREA COASTAL AREA	LCA Mississippi River Delta Management Study	MR-16	OT	USACE	ST JOHN THE BAPTIST	N/A	N/A	Pending/On Hold	\$25,358,336	This project evaluates a small freshwater diversion (less than 5,000 cfs) to introduce sediment and nutrients into Maurepas Swamp in order to facilitate organic deposition, improve biological productivity, and prevent further deterioration of the swamp. The state is using surplus funds as part of the required cost-share for this project. Fully funded Phase 2 cost was projected at the projected cost estimates.	1, 2	
LOUISIANA COASTAL AREA COASTAL AREA	Small Diversion at Hope Canal	PO-67	FD	USACE	ST JOHN THE BAPTIST	N/A	N/A	Pending/On Hold	\$150,000,000	This project evaluates a small diversion of up to 5,000 cfs from the Mississippi River into the Blind River through a new control structure surpluses funds as part of the required cost-share for this project. Fully funded Phase 2 cost was projected at the projected cost estimates.	1	
LOUISIANA COASTAL AREA COASTAL AREA	LCA Small Diversion at Convent / Blind River	PO-68	FD	USACE	ST JAMES, ASCENSION, LIVERNOSTON, ASCENSION	N/A	N/A	Pending/On Hold	\$123,140,000	This project evaluates a small diversion of up to 5,000 cfs from the Mississippi River into the Blind River through a new control structure to introduce freshwater, sediments, and nutrients into the southeastern portion of the Maurepas Swamp and natural water bodies. The project was transferred from the LCA program and is being implemented as State project PO-142.	1	
LOUISIANA COASTAL AREA COASTAL AREA	LCA Amite River Diversion Canal Modification (Transferred)	PO-69	VP/HR	USACE	LIVERNOSTON	N/A	N/A	Transferred	\$0,10,760,000	The goals of this project is to restore hydrologic connectivity between the Maurepas Swamp and natural water bodies. The project was transferred from the LCA program and is being implemented as State project PO-142.	1	
LOUISIANA COASTAL AREA COASTAL AREA	LCA Barataria Land Bridge Between Caloueste Lake and Gulf of Mexico	TE-67	MC	USACE	TERREBONNE	N/A	N/A	Pending/On Hold	\$62,600,000	The goals of this project are to prevent connection between the gulf and Caloueste Lake by constructing shoreline protection on the gulf shore erosion and increases saltwater intrusion on marshes in project area.	3A	
LOUISIANA COASTAL AREA COASTAL AREA	LCA Point Au Fer	TE-68	SP	USACE	TERREBONNE	N/A	N/A	Pending/On Hold	\$48,300,000	The goal of this project is to stabilize gulf shorelines and Point Au Fer land banks. This would mitigate historical bodies thereby preventing conversion of existing wetlands to marine habitat.	3A	
LOUISIANA COASTAL AREA COASTAL AREA	LCA Terrebonne Basin Barrier Shoreline Restoration	TE-70	BH	USACE	TERREBONNE	N/A	N/A	Pending/On Hold	\$133,300,000	This project provides for the restoration of the Timbalier and Isles Dernieres barrier land banks. This would mitigate historical conditions by reducing the current number of breaches, enlarging (width and dune crest) of the Isles Dernieres (Racoon Island, East Island, Trinity Island, Wine Island, and Whiskey Island), Timbalier Island, and East Timbalier Island.	3A	
LOUISIANA COASTAL AREA COASTAL AREA	LCA Convey Atchafalaya River Water to Northern Terrebonne Marshes	TE-71	HR	USACE	TERREBONNE	N/A	N/A	Pending/On Hold	\$349,985,500	The project would increase existing Atchafalaya River influence to central (Lake Boudreaux) and eastern (Grand Bayou) Terrebonne marshes via the Gulf Intracoastal Waterway (GIWW).	3A	
NFWF	Caminada Headland Beach and Dune Restoration Increment 2	BA-143	BH	N/A	JEFFERSON, LAFOURCHE	532	N/A	Pending	\$147,063,587	This project will restore and protect beach and dune habitat across the Caminada Headland through the direct placement of approximately 5.4 million cubic yards of sand material from Ship Shoal (an offshore borrow source). The project footprint begins near Bayou Marœau and extends approximately 9 miles east towards Caminada Pass. A total of 489 acres of beach and dune habitat will be restored.	2	
NFWF	Mid-Barataria Diversion	BA-153	SD	N/A	PLAQUEMINES	68,000	N/A	Pending	In Development	The MBD is a large and complex civil works and restoration project. MBSD. When in operation, would transfer sediment-laden water from the Mississippi River through a self-contained channel roughly 1.5 miles long, before on-titling past the back levee into mid-Barataria Basin. The project will restore the natural deltaic and sedimentation processes along the Mississippi River near River Mile 60.7 just north of Ironon. The MBSD would be expected to build and nourish ten to thirty thousand acres of critical coastal wetlands over a 50 year period, being top contribution to the 2012 Master Plan's goal of achieving no net loss of land in the future.	2	
NFWF	Lower Barataria Diversion	BA-163	SD	N/A	PLAQUEMINES	In	N/A	Pending	In Development	The purpose of this project is to construct a sediment diversion to build, sustain, and maintain wetlands. The project intends to build a sediment diversion in the lower Barataria Bay in the vicinity of Empire.	2	
NFWF	Lower Breton Diversion	BS-23	SD	N/A	PLAQUEMINES	In	N/A	Pending	In Development	The purpose of this project is to construct a sediment diversion from the Mississippi River into the Lower Barataria Basin to reestablish deltaic processes in order to build, sustain, and maintain wetlands. The project intends to build a sediment diversion in the lower Breton Sound in the vicinity of Black Bay around 50,000 cfs capacity.	2	
NFWF	Mid Breton Diversion	BS-25	DI	N/A	PLAQUEMINES	In	N/A	Pending	In Development	The purpose of this project is to evaluate a sediment diversion located in the vicinity of White Duck around 75,000 cfs.	1	
NFWF	Increase Atchafalaya Flow to Eastern Terrebonne	TE-110	SD	N/A	TERREBONNE	In	N/A	Pending	In Development	The purpose of the project is to utilize freshwater and sediment from the Atchafalaya River in order to build, sustain, and maintain wetlands within the Terrebonne Basin. The project intends to dredge the GIWW east of the Atchafalaya and install a bypass structure at Bayou Beaufort Lock to increase freshwater and sediment flows from Atchafalaya River to Terrebonne marshes.	3A, 3B	
NFWF	East Timbalier Island Restoration	TE-118	BH	N/A	LAFOURCHE	In	N/A	Pending	\$74,000,000	This project will engineer and design a restoration of dune, supratidal, and intertidal habitat, such that the two presently remaining, severely degraded island segments will be reconstructed and the historic island footprint re-established, which will improve bird and fish habitat, help protect oil and gas infrastructure, and provide hurricane surge protection for western Lafourche Parish.	3A	
NRDA	Cheniere Ronquille Barrier Island Restoration	BA-76	BH/MC	NMFS	PLAQUEMINES	408	N/A	Pending	\$38,883,175	The objective of this project is to prevent breaching of the barrier shoreline by restoring the dune and marsh platform. Project was designed under CWP/PRA, but will seek NRDA funds for construction.	2	
NRDA	Shell Island West-NRDA	BA-111	BH	N/A	PLAQUEMINES	347	N/A	Pending	\$10,152,4280	This project aims to restore the integrity of the Shell Island West barrier island, reduce wave energies within the bay area, and beach.	2	
NRDA	Lake Hermitage Marsh Creation Increment 2	BA-141	MC	N/A	PLAQUEMINES	101	N/A	Pending	\$139,000,000	This project will create 101 acres of marsh building off the BA-42 Lake Hermitage CWP/PRA project utilizing NRDA early restoration funds.	2	
NRDA	NRDA Calouste Lake Headlands	TE-100	BH	N/A	TERREBONNE	1272	N/A	Pending	\$111,309,000	This project aims to restore the Whiskey Island Barrier Island in order to retain its geomorphologic form and ecologic function. It will create 170 acres of marsh habitat and 917 acres of dune and beach habitat.	3a	
OIL SPILL	Catacasieu Ship Channel Salinity Control Measures	CS-65	HR	N/A	CAMERON	In	N/A	Pending	In Development	The purpose of the project is to manage salinities being introduced into adjacent water bodies through the Catacasieu Ship Channel to reduce the rate of wetland loss in the surrounding wetlands. The project intends to construct features to prevent saltwater from entering wetlands adjacent to Catacasieu lake through the Catacasieu Ship Channel. Measures would control salinity spikes and would be constructed in a manner that would allow for the continued functioning and ideally improvement and increased viability of the Catacasieu Ship Channel and the Port of Lake Charles.	4	
OIL SPILL	Houma Navigation Canal Lock Complex	TE-113	HR	N/A	TERREBONNE	In	N/A	Pending	In Development	The Houma Navigation Canal Lock Complex (TE-113) is a part of the Morganza to the Gulf of Mexico Hurricane Protection Project. The structure will provide storm surge protection, increase freshwater distribution, and provide navigation along the Houma Navigation Canal. The initial step is to meet with stakeholders to discuss alternative design considerations for optimization of the preferred design.	3A	
OTHER	Lake Pontchartrain Mitigation Project	HPL-MIT	SP	N/A	ST JOHN THE BAPTIST	600	N/A	19963	\$2,222,892	This project consisted of a rear-shore, segmented brackishwater system in Lake Pontchartrain parallel to a five-mile reach of the Manchac Hurricane Protection project.	1	
OTHER	Coastal Wetlands Public Outreach	N/A	OT	N/A					\$40,000	The DNR Public Information Office provides a variety of printed materials, educational videos and cds, fact sheets, website information, events and school activities. Much of the Agency's educational outreach efforts include participating in conferences, workshops, civic and the Americas' WETLANDS campaign. As a result of the agency's educational outreach is a partnership with the Breaux Act Task Force committees. The Office has contributed to the publishing of hundreds of national articles over the past years. To contact the Louisiana Department of Natural Resources' Public Information Office online, email info@dnr.louisiana.gov.	COASTWIDE	

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Levee Improved	Construction Completion	Total Budget	Project Description	
										Levee	Channel
SECTION 204/135	MRGO, Breton Island Restoration, Mile 3 to 4.0	N/A	DM	USACE	PLAQUEMINES	26	N/A	1999	\$1,050,000	This Section 204 project utilized material from maintenance dredging activities along the Mississippi River Gulf Outlet (MRGO) to repair Breton Island.	1
SECTION 204/135	MRGO, Breton Island/Berm, Mile 2+0 -3	N/A	DM	USACE	PLAQUEMINES	N/A	N/A	1999	\$150,000	This Section 204 project utilized material from maintenance dredging activities along the Mississippi River Gulf Outlet (MRGO) to nourish the littoral system that feeds Breton Island.	1
SECTION 204/135	Mississippi River Gulf Outlet Berm, Mile 14 to 11	N/A	DM	USACE	ST BERNARD	50	N/A	1999	\$350,000	This project provided for the unconfined placement of 3,468,801 cubic yards of material into shallow water adjacent to the south jetty at about mile 15.3. The material was dredged from miles 14.0 to 11.0 of the Mississippi River Gulf Outlet (MRGO) navigation channel and placed to an elevation conducive to marsh vegetation establishment.	1
SECTION 204/135	Mississippi River Gulf Outlet, Mile 14 to 12 (2002)	N/A	DM	USACE	ST BERNARD	50	N/A	2002	\$290,000	The project involved pumping approximately 1.6 million cubic yards to create some 50 acres of marsh behind the MRGO jetty. This project was fast tracked due to the impact of Hurricane Lili and tropical storm Isidore in 2002.	1
SECTION 204/135	Mississippi River Gulf Outlet, Mile 14 to 12 (2003)	N/A	DM	USACE	ST BERNARD	113	N/A	2003	\$680,000	This project involved pumping 4.3 million cubic yards of sediments to create 113 acres of marsh. The material was dredged from miles 14.0 to 12.0 of the Mississippi River Gulf Outlet (MRGO) navigation channel and placed at an elevation conducive to marsh vegetation establishment.	1
SECTION 204/135	Barataria Bay Waterway Grand Tere Island Ph 2	N/A	DM	USACE	JEFFERSON	125	N/A	1999	\$140,000	This Section 204 project utilized dredged material taken from a zone between miles 31 and 24.5 of the Barataria Bay Waterway (BBW) to create marsh habitat.	2
SECTION 204/135	Catacas River and Pass (Sabine NWR) Phase I, II, III	N/A	DM	USACE	CAMERON	480	N/A	2002	\$100,000	This Section 204 project provided for the beneficial placement of 500,000 cubic yards of material dredged from the Barataria Bay Waterway (BBW) to create wetlands on the bay side of Grand Tere Island.	4
SECTION 204/135	Barataria Bay Waterway Grand Tere Island Phase I	N/A	DM	USACE	TERREBONNE	37	N/A	1991-2003	\$1,560,804	This Section 204 project provides for the disposal of dredged material removed from the area between mile 7.5 and 11.5 of the Calcasieu Ship Channel. A total of 4 million cubic yards of material was deposited in three phases within the Sabine National Wildlife Refuge at an elevation conducive to marsh creation.	3A
SECTION 204/135	Wine Island Restoration	DSR-81558	DM	USACE	TERREBONNE	50	N/A	2002	\$1,007,000	This Section 204(135) project was a cooperative effort with the USACE and included the use of beneficial dredging from a scheduled Houma Navigation Channel maintenance dredging project to restore Wine Island.	2
SECTION 204/135	Barataria Bay Waterway, Grand Tere Island (Phase I)	N/A	DM	USACE	JEFFERSON	115	N/A	1998	\$1,370,000	This Section 204 project provides for the beneficial placement of 500,000 cubic yards of dredged material from the Barataria Bay Waterway (BBW) to create wetlands on Grand Tere Island.	2
SECTION 204/135	Houma Navigation Canal, Wine Island Barrier Island Restoration	N/A	DM	USACE	TERREBONNE	315	N/A	1999	\$1,132,435	The project will restore, to the extent possible, the natural hydrology of the area. A reduction in marsh loss and improved water conditions are expected to occur following project implementation. Long-term water management objectives will be directed towards maintaining a brackish marsh system.	4
STATE	Alexandria to the Gulf	AT-12	OT	N/A	RAPIDES	N/A	N/A	N/A	\$970,000	This feasibility study is intended to evaluate options and alternatives for providing urban drainage and flood reduction to the City of Alexandria and irrigation and flood reduction benefits to agricultural areas south and southeast of the city.	3B
STATE	Atchafalaya Basin Natural Resources Inventory and Assessment	AT-13	OT	N/A	ST MARY, IBERIA, ST MARTIN	N/A	N/A	N/A	\$1,450,000	This project assesses and inventories the natural resources in the Atchafalaya Swamp.	3B
STATE	Naomi Siphon Diversions	BA-03	FD	N/A	PLAQUEMINES, JEFFERSON	8200	N/A	1992	\$9,602,381	This project involved the construction of eight parallel siphons to divert water from the Mississippi River into the adjacent wetlands near Naomi, Louisiana. The maximum discharge of the siphons is 2,100 cfs.	2
STATE	West Pointe à la Hache Siphon Diversions	BA-04	FD	N/A	PLAQUEMINES	9200	N/A	1992	\$9,845,693	This project involved the construction of eight parallel siphons to divert water from the Mississippi River into the adjacent wetlands on the west side of the river near Pointe à la Hache, Louisiana. The maximum discharge of the siphons is 2,100 cfs.	2
STATE	Queen Bess	BA-05B	SP, DM	N/A	JEFFERSON	145	N/A	1993	\$1,475,176	The purpose of this project is to restore Queen Bess Island as a brown pelican (Pelecanus occidentalis) rookery. Dredged material was added to the island to increase its size in 1991, and a rock dike was built around the perimeter of the original island in 1992 to armor the shoreline. The area has become vegetated and the number of pelican nests on the island increased after project construction.	2
STATE	Baie de Chacass	BA-05C	SP	N/A	ST CHARLES	130	N/A	1990	\$175,000	Approximately 300,000 pounds of crushed oyster shell were placed on 7,400 feet of shoreline to restore the physical integrity of the marsh shoreline separating Lake Salvador and Baie de Chacass and Baie du Cabane.	2
STATE	Lake Salvador Shoreline Protection Extension	BA-15-X1	SP	N/A	ST CHARLES	2035	N/A	2005	\$4,840,344	The purpose of this project is to build a rock dike that will protect the marsh shoreline along the northeastern portion of Lake Salvador. The shoreline protection project was built on the land to avoid dredging in an area with cultural resources. This project was designed as an extension of the BA-15 Phase II CWPPRA project.	2
STATE	Bayou Segnette	BA-16	SP	N/A	JEFFERSON	88	N/A	1994, 1998	\$1,373,151	This project involved the construction of a 6,800-foot limestone rock dike to reinforce the bank between Lake Salvador and Bayou Segnette and the installation of a timber piling fence across an abandoned access canal on the two water bodies. The fence is designed to reduce wave energies and erosive forces from the lake while still allowing exchange of sediment and aquatic organisms. Additional CWPPRA funds were appropriated for the design of this state-funded project. Maintenance of this project was necessary in the 1998-1999 fiscal year at a cost of \$300,000.	2
STATE	Bayou Lafourche Freshwater Introduction	BA-25	FD	N/A	LAFOURCHE	Not Available	N/A	2011	\$20,000,000	The Mississippi River diversion into Bayou Lafourche will restore coastal marshes and provide drinking water to over 300,000 residents. This project funded the dredging of the first 6.2 miles of the bayou to accommodate a proposed increased flow of 1,000 cfs.	2
STATE	Plaquemines Parish - Southeast Louisiana Strategic Restoration	BA-46 SF	MC	N/A	PLAQUEMINES	N/A	N/A	N/A	\$4,500,000	This project provided State funding to supplement a Plaquemines Parish dredging design project.	2
STATE	Jean Lafitte Tidal Protection	BA-75-1	HP	N/A	JEFFERSON	N/A	2.9	Pending	\$15,730,000	This project will provide flood protection improvements by raising 15,840 linear feet of existing earthen levees. The project will also include approximately 7000 linear feet of concrete capped, steel sheet pile floodwall and flood gates to 6.0 NAVD.	2
STATE	Rosehome Tidal Protection	BA-75-2	HP	N/A	JEFFERSON	N/A	5.3	Pending	\$20,500,000	This project will provide flood protection improvements consisting of new earthen levees, approximately 8,010 linear feet of reinforced concrete floodwall and flood gates to 8.0 NAVD.	2
STATE	St. Charles West Bank Hurricane Protection Levee	BA-85	HP	N/A	ST CHARLES	N/A	9	Pending	\$14,500,000	This project is a system of levees, drainage structures and pump stations being constructed to provide flood protection to the communities of St. Charles Parish on the West Bank of the Mississippi River.	2
STATE	Bayou Lafourche Salt Water Control Structure	BA-91	OT	N/A	LAFOURCHE	N/A	N/A	Pending	\$4,890,000	This project will allow salinity levels in Bayou Lafourche to be more effectively managed through operation of the saltwater control structure.	2
STATE	Grand Isle East End Breakwater/ Jetty Design	BA-92	SP	N/A	JEFFERSON	N/A	N/A	N/A	\$1,000,000	This project provided funding for the design of breakwaters/jetties work for Grand Isle State Park.	2

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Levee Improved	Construction Completion	Total Budget	Project Description	Planning Unit
STATE	Donaldsonville to the Gulf of Mexico Hurricane Protection	BA-115	HP	USACE	ASSUMPTION, JEFFERSON, LAFOURCHE, ST JOHN THE BAPTIST, ST CHARLES, ST JAMES	N/A	N/A	Pending/On Hold	\$10,269,987	The purpose of the project is to reduce the risk of flooding from coastal storm surge and rainfall to prevent further economic losses and environmental damage in the Barataria Basin. The project is currently in its feasibility study phase, during which various alternatives to reducing storm surge are being examined; the adequacy of the existing drainage system is being assessed, and cultural, environmental, and recreational issues are being identified. The scope is to study various alternatives that will provide flood protection from tidal, hurricane surges, and heavy rainfall events, determine the adequacy of the existing interior drainage systems and evaluate whether additional pumping capacity is required, and analyze recreational, cultural, and environmental needs.	2
STATE	Grand Isle-Flî Island Breakwaters	BA-168	SP	N/A	JEFFERSON	N/A	N/A	Pending	\$6,000,000	The project will construct breakwaters along the southeastern portion of Flî Island to reduce erosion on Flî Island and the bay side of Grand Isle in order to protect commercial and residential infrastructure, wetlands, and fisheries. The project includes renourishment of 1,450 feet of existing breakwaters to an elevation of 6 feet and construction of new breakwaters to an elevation of 6 feet.	2
STATE	Kraemer Bayou Beauft levee lift	BA-169	HP	N/A	LAFOURCHE	N/A	6	Pending	\$1,000,000	This project will improve and reinforce approximately 23,000 feet of levees surrounding the Kraemer Community, a forced drainage area. The levees were not sufficient following Hurricane Isaac and overtopped.	2
STATE	Breach Management Plan	BA-170	BH	N/A	JEFFERSON, LAFOURCHE, PLAQUEMINES, TERREBONNE	N/A	N/A	N/A	\$7,106,511	This project involves the development of a systematic program for handling breaching that occurs within the barrier island and headland systems of the Louisiana coastline. The project will extend eastward from Racoon Island to Scifield Island within the Terrebonne and Barataria Basins. The project will include development of identification, classification, and prioritization methodologies with recommendations for breach prevention and response measures. The project goals are to reverse landloss, increase sustainability of restoration projects, reduce operations and maintenance costs, and improve ecosystems.	2, 3A
STATE	Brannon Ditch	BD	SP	N/A	CALCASIEU	480	N/A	1991	\$2,440	This project included the construction of wooden breakwater fences along 2,200 feet of the GIWW across from Brannon Ditch in Calcasieu Parish. This area has experienced shoreline erosion in excess of 25 feet/year. The breakwaters reduce wave action from boats and the current from Brannon Ditch during periods of high discharge. Smooth cordgrass (<i>Spartina alterniflora</i>) was also planted behind the breakwaters in order to enhance accretion and increase the stability of this site.	4
STATE	Brown Marsh	BRM-01	MC	N/A	LAFOURCHE	44	N/A	2002	\$473,365	Project features consisted of a thin layer marsh creation/investment covering 44 acres in Lafourche Parish.	3A
STATE	Lake Lery Hydrologic Restoration	BS-06	FD	N/A	ST BERNARD	100	N/A	1997	\$1,000,000	This project involved the construction of a pumping station located along the south-central edge of the St. Bernard Parish Ridge. This will discharge collected rainfall into the marsh north of Lake Lery and help prevent saltwater intrusion. The project was built in partnership with the Lake Borgne Basin Levee District and was completed in May of 1997.	1
STATE	Cheniere Au Tigre	CAT-01	SP	BOEMRE	VERMILION	40	N/A	2005	\$1,802,227	The primary objective of this project is to protect the Cheniere au Tigre shoreline from additional erosion and protect local infrastructure. The project used segmented rock breakwater structures to help reduce the rate of shoreline erosion and promote sediment deposition along the beach north of the breakwater structures. The proposed series of segmented breakwaters was placed just east of the CWPPRA funded TV-16 project with up to nine additional structures. The structures cover approximately 2,800 linear feet with an approximate distance of 240 feet from the existing shoreline.	3B
STATE	Holy Beach	CS-01	SP	N/A	CAMERON	88	N/A	1991, 1992, 1993, 1994	\$8,437,000	The objective of this project is to protect the marsh north of the Gulf of Mexico shoreline by expanding shoreline protection in phases from Ocean View, Louisiana to the east near Calcasieu Pass. A total of 34 breakwaters were constructed in 1991, 21 breakwaters were constructed in 1992, 21 breakwaters were constructed in 1993, and nine breakwaters were constructed in 1994 between Calcasieu Pass and Holy Beach, Louisiana. Eighteen of the existing breakwaters were raised and/or extended in 2003 utilizing marine matress foundations and armor stone.	4
STATE	Ryecade Canal Marsh Management	CS-02	MM	N/A	CAMERON	6575	N/A	1994	\$2,005,657	The project was designed to stabilize salinities and water levels by reducing water flows through Ryecade canal and Black Lake.	4
STATE	Cameron Creole Levee	CS-04a	HP	N/A	CAMERON	2602	N/A	2011	\$12,600,000	The intent of this project is to provide for repair and maintenance of critical perimeter control structures around Calcasieu Lake and repars to the Cameron-Creole Levee. These structures were severely damaged by Hurricane Rita.	4
STATE	Cameron-Creole Structure Automation	CS-04A-1	HR	N/A	CAMERON	N/A	N/A	1999	\$700,000	This project consists of automating three existing water control structures along the east shore of Calcasieu Lake. These structures are remotely located and are difficult to manipulate. Automation of these structures will improve management capabilities in the Sabine National Wildlife Refuge.	4
STATE	Cameron Parish Shoreline Restoration	CS-33	OT	N/A	CAMERON	523	N/A	2014	\$45,800,000	The project involved the re-establishment of dunes and beachhead for 8.7 miles extending from the western Calcasieu River Jetty to the eastern most breakwater at the Holly Beach - Constantine Beach breakwater field.	4
STATE	Black Lake Supplemental Beneficial Use Disposal Area	CS-34	DM	USACE	CAMERON	440	N/A	2010	\$21,034,329	The project beneficially used dredged sediment from maintenance dredging of the Calcasieu River Ship Channel from mile 14 thru mile 17 for delivery by sediment pipeline to the Black Lake/Marcantel Beneficial Use site.	4
STATE	Beneficial Use - Calcasieu Ship Channel (Black Lake)	CS-34 SF	DM	N/A	CAMERON	300	N/A	2010	\$8,000,000	The purpose of this project is to create approximately 300 acres marsh through beneficial use of dredged material from the Calcasieu Ship Channel.	4
STATE	Blind Lake	CS-BL	SP	N/A	CAMERON	480	N/A	1989	\$173,433	The purpose of this project was to prevent the Gulf Intracoastal Waterway from breaching in Blind Lake. The project consisted of placing a 339 linear feet of limestone breakwater along the south side of the GIWW adjacent to Blind lake. The second phase of this project included planting giant catclaws (<i>Zizaniopsis milletsia</i>) along the inside of the breakwater to enhance the accretion process.	4
STATE	Sabine Terraces	CS-ST	SHIT	N/A	CAMERON	110	N/A	1990	\$190,047	A total of 128 earthen terraces were constructed in a checkboard pattern and planted with smooth cordgrass (<i>Spartina alterniflora</i>) in open water areas of the Sabine National Wildlife Refuge. The project's objective was to increase the length of marsh-water interface, re-establish emergent marsh vegetation, reduce marsh fringe retreat by reducing wind-generated wave energy, increase overall primary productivity, and promote the deposition of suspended sediment.	4
STATE	Fisheries Habitat Restoration on West Grand Terre Island at Fort Livingston	FTL-01	SP	N/A	JEFFERSON	No Available	N/A	2003	\$2,076,816	This project consists of a rock dike built to protect the Gulf shoreline of West Grand Terre and Fort Livingston. This project was expedited because erosion rates along West Grand Terre rapidly accelerated due to the impacts of tropical storms in 2002.	2
STATE	Grand Isle Bay Side Breakwaters	GIBSB	SP	N/A	ST CHARLES	50	N/A	1995	\$60,000	The purpose of this project was to reduce erosion on the bay side of Grand Isle. Fifteen 300-foot breakwaters were constructed on the back-tay side of Grand Isle.	2
STATE	Dedicated Dredging Program - Lake Salvador	LA-01a	MC, DM	N/A	JEFFERSON	28	N/A	1999	\$342,276	Two sites were filled utilizing dredged material adjacent to Baie du Cabangue on the Salviere River. The goal of this program is to use a small, mobile hydraulic dredge along part of the coastwide state Dedicated Dredging Program. The goal of this program is to use a small, mobile hydraulic dredge along inland waterways in Louisiana's coastal zone to deposit dredged material, and thereby nourish and/or rebuild threatened coastal marshes adjacent to the waterways.	2
STATE	Dedicated Dredging Program - Bayou Dupont	LA-01b	DM, MC	N/A	JEFFERSON	66	N/A	2000	\$1,080,017	Three sites were filled utilizing dredged material adjacent to Bayou Dupont and The Pen. This project is part of the coastwide state Dedicated Dredging Program. The goal of this program is to use a small, mobile hydraulic dredge along inland waterways in Louisiana's coastal zone to deposit dredged material, and thereby nourish and/or rebuild threatened coastal marshes adjacent to the waterways.	2
STATE	Pass a Louire Site - Dedicated Dredging Program	LA-01C	DM	N/A	PLAQUEMINES	26	N/A	2005	\$450,000	The project created approximately 26 acres of sustainable freshwater marsh in the vicinity of Pass a Louire, Louisiana. This project is part of the coastwide state Dedicated Dredging Program. The goal of this program is to use a small, mobile hydraulic dredge along inland waterways in Louisiana's coastal zone to deposit dredged material, and thereby nourish and/or rebuild threatened coastal marshes adjacent to the waterways.	1

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Levee Improved	Construction Completion	Total Budget	Project Description		Planning Unit
										Levee	Bank	
STATE	Terrebonne School Board Site - Dedicated Dredging	LA-01D	D	N/A	TERREBONNE	40	N/A	2006	\$2,559,587	This project created approximately 40 acres of marsh just north of Lake DeCade along the western bank of Minors Canal. This project is part of the statewide state Dedicated Dredging Program. The goal of this program is to use a small, mobile hydraulic dredge along inland waterways in Louisiana's coastal zone to deposit dredged material, and thereby nourish and/or rebuild threatened coastal marshes adjacent to the waterways.	3B	
STATE	Grand Bayou Blue Site - Dedicated Dredging	LA-01E	D/M, MC	N/A	LAFOURCHE	38	N/A	2007	\$1,631,534	This project created approximately 38 acres of marsh near Catfish Lake using dredged material from Grand Bayou Blue. This project is part of the statewide state Dedicated Dredging Program. The goal of this program is to use a small, mobile hydraulic dredge along inland waterways in Louisiana's coastal zone to deposit dredged material, and thereby nourish and/or rebuild threatened coastal marshes adjacent to the waterways.	3A	
STATE	Dedicated Dredging - Point au Fer	LA-01F	D	N/A	TERREBONNE	67	N/A	2007	\$2,469,250	This project created approximately 67 acres of marsh on Pont Au Fer Island adjacent to the CWPRA TE-26 project using material dredged from Atchafalaya Bay. This project is part of the statewide state Dedicated Dredging Program. The goal of this program is to use a small, mobile hydraulic dredge along inland waterways in Louisiana's coastal zone to deposit dredged material, and thereby nourish and/or rebuild threatened coastal marshes adjacent to the waterways.	3B	
STATE	Southwest Coastal Louisiana Feasibility Study	LA-20	D/M, TE, SP, MC	USACE	CALCASIEU, VERMILION, CAMERON	In Development	In	Pending	\$8,800,000	This project integrates ecosystem restoration and hurricane protection alternatives to address the coastal issues of Southwest Louisiana. It includes shoreline stabilization, marsh creation, salinity control, hurricane protection, and oyster restoration measures. Project was	4	
STATE	Sabine Cycle 2	LA-21.1	D	N/A	COASTWIDE	227	N/A	2010	\$6,600,000	The purpose of this project is to cover the cost of marsh fill for the Sabine Refuge Marsh Creation, Cycle 2 Reaux Act project.	4	
STATE	MAS1 - Management	LA-211	OT	N/A	N/A	N/A	N/A	N/A	\$200,000	This project is to recognize activities undertaken by the State of Louisiana's Coastal Protection and Restoration Authority as part of the active process of managing multiple floodplain trapping projects for the coastal area of Louisiana.	3B	
STATE	Pecan Island Freshwater Introduction	ME-01	F	N/A	VERMILION	39000	N/A	1992	\$487,152	The purpose of this project is to introduce freshwater from the north to counteract the saltwater intrusion from the south. The project consists of two water control structures and approximately 5,700 linear feet of earthen embankment needed to channel water from White Lake to the south marshes.	4	
STATE	Marsh Creation Near Freshwater Bayou	ME-25 SF	MC	N/A	VERMILION	96	N/A	Pending	\$55,700,000	The purpose of this project is to create 96 acres of marsh southeast of intersection of Acadia Canal and Freshwater Bayou.	4	
STATE	Small Sediment Diversion	MR-01B	SD	N/A	PLAQUEMINES	6719	N/A	1993	\$1,010,500	This project involved the excavation of 13 crevasses through the levees of Mississippi River distributary channels within the Baile Delta	1	
STATE	North Grand Isle Breakwaters	NGI	SP	N/A	JEFFERSON	50	N/A	1995	\$160,000	This project was authorized to construct segmented rock breakwaters on the bay side of Grand Isle to protect camps located between Caninada Bay and the west side of Louisiana Hwy 1. The Louisiana Department of Natural Resources (LDNR) contributed no construction funds and was involved in construction inspection only. The local Levee District supplied construction funds.	2	
STATE	Violet Siphon Diversion	PO-01	F	N/A	ST BERNARD	84	N/A	1992	\$380,584	The purpose of this project is to return to operation the existing siphon, and to enlarge the size of the diversion so that more sediment and freshwater are available to offset marsh subsidence and saltwater intrusion.	1	
STATE	Bayou Cheve	PO-02c	SP	N/A	ORLEANS	75	N/A	1994	\$62,000	This project installed 2,000 feet of brush fences at the mouth of Bayou Cheve.	1	
STATE	LaBranche Shoreline Stabilization and Canal Closure	PO-03	SP	N/A	ST CHARLES	1750	N/A	1987	\$1,324,000	The purpose of this project is to restore the integrity of the shoreline, which separates Lake Pontchartrain from the western edge of the LaBranche wetlands.	1	
STATE	LaBranche Shoreline Protection	PO-03B	SP	N/A	ST CHARLES	50	N/A	1993	\$1,290,851	A rock breakwater was constructed along the Lake Pontchartrain shoreline, east of Bayou LaBranche, to protect the hydrologic boundary between the lake and the wetlands from being breached.	1	
STATE	Central Wetlands Pump Outfall	PO-08	F	N/A	ST BERNARD	300	N/A	1992	\$250,000	This project is designed to provide freshwater, nutrients, and sediment associated with storm water runoff to an area of marsh near the Violet Shrimp (PO-01).	1	
STATE	Turtle Cove Shore Protection	PO-10	SP	N/A	ST JOHN THE BAPTIST	184	N/A	1994	\$366,000	This project involved the construction of a 1,640 foot rock-filled gabion breakwater to maintain and protect the Lake Pontchartrain shoreline that shelters "The Prairie" (an 800-acre expanse of shallow open water marsh bordered by organic freshwater marsh) from high wave energies and to encourage sediment deposition behind the gabion structure. An additional \$195,600 was used for maintenance in 2001.	1	
STATE	River Reinroduction into Maurepas Swamp	PO-29	F	EPA	ST JOHN THE BAPTIST, ST JAMES	36121	N/A	Pending	\$147,028,735	This project intends to restore a natural hydrologic regime and increase nutrient inputs in cypress-tupelo swamp tracts south of Lake Maurepas through its diversion of Mississippi River water into an area of degraded swamp. The project was originally proposed under CWPRA but underwent subsequent development as a State-only project.	1	
STATE	MRGO Closure Structure	PO-36SF	OT	USACE	ST BERNARD	2343	N/A	2009	\$14,161,500	This project involves the installation of a closure structure in the Mississippi River Gulf Outlet (MRGO) to prevent the intrusion of saline Gulf waters into interior marsh via the channel. Project implementation was 100% Federal; the State acquired Real Estate interests or structure and is responsible for O&M activities.	1	
STATE	St. Bernard Parish 40 Acre Levee Repairs	PO-61	HP	N/A	ST BERNARD	N/A	Not Available	2011	\$5,000,000	This project is in the Lake Borgne Levee District and provided funds for the raising of low reaches of the Forty Acre Levee.	1	
STATE	Bloxii Marsh	PO-72	SP	N/A	ST BERNARD	300	N/A	2014	\$22,000,000	This project involved the construction of approximately four miles of shoreline protection along the southeastern shoreline of Lake Borgne.	1	
STATE	North Shore Hurricane/Flood Protection and Restoration Plan	PO-74	OT	N/A	ST TAMMANY, TANGIPAHOA	N/A	N/A	N/A	\$1,271,898	This project involves the development of a hurricane protection plan for the North Shore.	1	
STATE	MRGO and Lake Borgne (Bayou Dupre Segment)	PO-93	SP	USACE	ST BERNARD	N/A	N/A	Pending	Not Available	This project will construct approximately 7,850 linear feet of stone frontshore dike along the southwest shoreline of Lake Borgne in the vicinity of Bayou Dupre. CPRA is acquiring portions of the two oyster leases that are impacted by this project.	1	
STATE	MRGO and Lake Borgne (Bayou Bienvenue Segment)	PO-94	SP	USACE	ST BERNARD	N/A	N/A	Pending	Not Available	This project will construct approximately 14,440 linear feet of stone frontshore dike along the southwest shoreline of Lake Borgne in the vicinity of Bayou Bienvenue. CPRA is acquiring portions of the three oyster leases that are impacted by this project.	1	
STATE	MRGO and Lake Borgne (Shell Beach Segment)	PO-95	SP	USACE	ST BERNARD	N/A	N/A	Pending	Not Available	This project will construct approximately 15,700 linear feet of stone frontshore dike along the southern shoreline of Lake Borgne, west of Shell Beach. CPRA is acquiring portions of the four oyster leases that are impacted by this project.	1	
STATE	MAS2 - Outreach	PO-129	OT	N/A	JEFFERSON, ORLEANS	N/A	N/A	N/A	\$266,670	The objective of this project is to support the release by the Federal Emergency Management Agency (FEMA) of a Digital Flood Insurance Rate Map (DFIRM) and F-Index Insurance Study (FIS) report, for the Rerier New Orleans area.	1	
STATE	Hydrologic Restoration of the Amite River Diversion Canal	PO-142	HR VP	N/A	ASCENSION, LIVINGSTON	1600	N/A	Pending	\$3,592,100	The purpose of this project is to establish hydrologic connectivity between Maurepas Swamps and natural waterbodies; plant vegetation in highly degraded swamp habitat.	1	
STATE	Fontainebleau State Park Mitigation	PO-435ENP4	SP	N/A	ST TAMMANY	6	N/A	1999	\$476,104	This project repaired a section of breached shoreline by depositing approximately 9,000 cubic yards of sand for a feeder berm on the easternmost end of Fontainebleau State Park.	1	

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRA Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Miles of Levee Improved	Construction Completion	Total Budget	Project Description		Planning Unit
STATE	Raccoon Island Repair	RI	DM	N/A	TERREBONNE	197	N/A	1994	\$1,400,000	This project was a cooperative effort that utilized dredged material and vegetation to repair storm damage to Raccoon Island.	3A	
STATE	Spoilbank along the GIWW	SBG	VP	N/A	TERREBONNE	1	N/A	1993	\$9,400	Cooperators include the Louisiana Department of Natural Resources/Capital Restoration Division, Louisiana Department of Wildlife and Fisheries/Fur and Refuge Division, Terrebonne Parish Consolidated Government, South Central Coastal Engineering & Environmental Consultants, Inc., and Beau Dredging, Federal Conservation District, T. Baker Smith & Son, Inc., Coastal Engineering & Environmental Consultants, Inc., and Beau Dredging, Federal grant money was also utilized for this project by LDWF and TPCG.	3A	
STATE	Sabine Shellbank Stabilization	SSB	SP	N/A	CAMERON	10	N/A	1990	\$66,000	The purpose of this project was to provide natural shoreline protection by using tidal currents to deposit clam shell on the shoreline. The benefits of this design over the use of permanent structures are lower cost, less disturbance of the natural habitat during construction, and allowing natural distribution of sediment and organisms without impairment.	4	
STATE	Montegut Wetland	TE-01	MM	N/A	TERREBONNE	4200	N/A	1993	\$5,537,036	The objective of the Montegut Wetland project is to protect and enhance ~200 acres of degraded wetland habitat in the Pointe au Chat Wetland Management Area south of Monette, Louisiana.	3A	
STATE	Faigout Canal Wetland	TE-02	MM	N/A	TERREBONNE	1300	N/A	1993, 1995	\$1,560,000	The primary objectives of this project were to protect approximately 8,000 acres of marsh and cypress-tupelo swamp, reduce saltwater intrusion, and improve wildlife habitat by moderating water flux and tidal energy in the deteriorating wetland community.	3A	
STATE	Bayou LaChacé Wetland	TE-03	MM	N/A	TERREBONNE	4374	N/A	1991, 1996	\$2,047,222	The goal of the project is to minimize the effects of saltwater intrusion by increasing the retention of freshwater derived from local runoff and establish control over saltwater flow into the project area.	3A	
STATE	Pointe Aux Chien Hydrologic Restoration	TE-06	MM	N/A	TERREBONNE	4700	N/A	2003	\$2,771,819	This cooperative coastal restoration project benefits approximately 4,700 acres of brackish-intermediate marsh within the Pointe Aux Chenes WMA managed by the Louisiana Department of Wildlife and Fisheries. Major funding for the project was provided by Ducks Unlimited and the North American Wetlands Conservation Act.	3A	
STATE	Lower Petit Caillou	TE-07B	HR	N/A	TERREBONNE	3465	N/A	1995, 2007	\$1,536,084	The objective of this project is to decrease saltwater intrusion into the project area by re-routing freshwater discharge from the Lashbrook pumping station through the project area prior to entry into Lake Boudreau.	3A	
STATE	Point Farm Refuge Planting	TE-14	VP	N/A	TERREBONNE	150	N/A	1995	\$226,931	This project was developed to create bottomland hardwood forests within the Point Farm Refuge Area (PFRA) in former farmlands within the Point Farm Refuge Area (PFRA).	3A	
STATE	Morganza to the Gulf	TE-64	HP	USACE	LAFOURCHE, TERREBONNE	N/A	18	Pending	\$136,703,835	The project is currently being designed to provide protection to Terrebonne and portions of Lafourche parishes to provide protection against the next project storm event. When complete, the project will consist of the construction of 66 miles of levees and t-walls, navigation structures, water control structures, and floodgates.	3A	
STATE	Larose to Golden Meadow - Flood Protection	TE-05	HP	N/A	LAFOURCHE	N/A	23	Pending	\$27,820,000	This project includes levee modifications and improvements. The project was allocated \$15 million in '08 Surplus and \$4.82 million in '09 Surplus.	2, 3A	
STATE	Lost Lake Vegetation Project	TE-42	VP	N/A	TERREBONNE	N/A	N/A	2011	\$161,000	This project consists of vegetative plantings on the shore and vicinity of Lost Lake.	3A, 3B	
STATE	HNC Deepening Section 203 Study	TE-108	OT	USACE	TERREBONNE	N/A	N/A	Pending	TBD	Feasibility Study and EIS preparation for investigating deepening of the HNC to accommodate the current fleet of large vessels utilizing the navigation channel, as well as the increased need for support of the offshore oil and gas platform fabrication operations along the HNC. This project is being managed by DOTD with interim funding being provided by CFWRA.	3A	
STATE	Valentine to Larose	TE-111	HP	N/A	LAFOURCHE	N/A	0.38	2014	\$1,000,000	This project provides flood protection improvements to the current flood protection system under local jurisdiction and consists of engineering, design, survey, repair, rehabilitation and possible construction of approximately 2,000 linear feet of levee along Bayou Lafourche, from the town of Valentine to the town of Larose.	2	
STATE	St. Mary Backwater Flooding	TE-116	HP	N/A	ST MARY, TERREBONNE	N/A	1.72	Pending	\$5,000,000	This project provides for flood protection improvement to the current Morgan City flood protection system by raising some of the existing levees to elevations as identified in the March 27, 2013 report by Baker Smith.	3B	
STATE	Yellow Bayou	TV-02b	SP	N/A	ST MARY	126	N/A	1992	\$194,500	The objectives of this project were to maintain the integrity of approximately 2,000 acres of interior marsh between Jackson Bayou and the British American Canal and to stabilize 7,485 feet of the East Cole Blanche Bay shoreline. This was achieved by constructing an oyster shell berm adjacent to the water's edge to reduce shoreline erosion.	3B	
STATE	Marsh Island Control Structures	TV-06	MM	N/A	IEIRIA	643	N/A	1993	\$453,500	The objectives of this project were to reduce the rate of land loss, revegetate shallow open-water areas, and increase waterfowl food within the water management units. Flap-gated drop culverts and earthen canal plugs were installed in October of 1993 at the northeast and southeast units to control water exchange between the units and the surrounding water bodies. Within the management units, canal spoil banks were breached and ditches were constructed to facilitate water movement between interior marsh ponds.	3B	
STATE	Freshwater Bayou Bank Protection	TV-11	SP	N/A	VERMILION	241	N/A	1994	\$2,177,025	This project conserves vegetated wetlands by maintaining the physical integrity of marshes that separate Freshwater Bayou and interior water bodies. The dominant project feature consists of the construction of 24,000 linear feet of rock dike, extending north to the confluence of Belle Isle Bayou and Freshwater Bayou. The original project was constructed in 1994; however, repairs were made to the structure in 1996 and 2001.	3B	
STATE	Oaks/Avery Structures	TV-138	SP	N/A	VERMILION, IBERIA	160	N/A	2000	\$3,107,735	This project enhanced the adjacent CWPPRA-funded TV-13a project by installing low-sill structures at the outfall of Oaks and Avery Canals to redirect more water through the portion of Bayou Petie Anne south of the GWW.	3B	
STATE	South Central Coastal Protection	TV-54	OT	USACE	ST MARY, ST MARTIN	In Development	In Development	Pending	\$3,870,000	This project will provide flood protection improvements by raising or improving over seven miles of the current levee system in the Morgan City area.	3B	
STATE	Morgan City/St Mary Flood Protection	TV-55	HP	N/A	ST MARY	N/A	4.5	Pending	\$970,000	The South Central Coastal project was authorized in 2009 in 2009 surplus funds. The project will include a flood control structure for the Delcambre-Avery Canal just south of the Intracoastal Waterway. It anticipates completing this phase of the project by the end of 2010. This information is based on the project will be kick start the project with US Army Corps of Engineers. Once study authorization is obtained from the US Congress the project will progress to the feasibility phase.	3B	
STATE	Delcambre-Avery Canal (E&D)	TV-57	HP	N/A	IEIRIA	N/A	N/A	N/A	\$4,000,000	This project will design and engineer a flood control structure for the Delcambre-Avery Canal from the sector gate at Laplace Boulevard to the existing levee at the west end, to provide interim hurricane protection during the construction of the HSRS system.	3B	
STATE	Quintana Canal/Cypremort Point	TV-435SNP1	SP	N/A	ST MARY	26	N/A	1993	\$1,316,818	This project features approximately 3,650 linear feet of rock breakwaters along the Vermilion Bay shoreline and approximately 3,375 linear feet of foreslope rock due along the Vermilion Bay/Quintana Canal intersect and the south bank of the Quintana Canal.	3B	
STATE	Beneficial Use of I-10 Twin Span Debris (Deauthorized)	N/A	OT	N/A	ORLEANS	N/A	N/A	Deauthorized	\$1,500,000	This project involves the use of twin span debris as a form of shoreline protection for the Bayou Sauvage area.	1	
STATE	East Harvey Canal Inlet Hurricane Protection - Phase I	N/A	HP	N/A	JEFFERSON	N/A	N/A	2009	\$4,000,000	This project involved the installation of a combination of sheet pile and batten flood protection, ultimately to an elevation of 10.0 feet along the east side of the Harvey Canal from the sector gate at Laplace Boulevard to the existing levee at the west end, to provide	2	
STATE	Raising of LA 1 at Golden Meadow Floodgate and Cypremort Lock Structure	N/A	HP	N/A	LAFOURCHE	N/A	N/A	2010	\$18,000,000	This project funded the raising of LA-1 to the 100-year flood level and to complete the lock in Bayou Lafourche, both critical elements of the lausee to Golden Meadow Hurricane Protection System.	2	
STATE	Raising of LA 22 at LaReussile	N/A	HP	N/A	PLAQUEMINES	N/A	N/A	N/A	\$1,200,000	This project involves the elevation of the adjoining La Reussile Siphon guide levees, where the highway crosses those above levees. LDOTD performed the engineering in house and let contracts to complete the lock in Bayou Lafourche.	2	
STATE	Bay Welsh Disposal Site (Houma Navigation Canal)	N/A	DM	N/A	TERREBONNE	N/A	N/A	N/A	\$300,000	The purpose of this project is to pre-clear the Bay Welsh disposal site adjacent to and east of the Houma Navigation Canal.	3A	

ONGOING PROTECTION AND RESTORATION PROJECT SUMMARIES

CPRa Program	Name	State Project Number	Project Type	Federal Sponsor	Parish	Acres Benefited	Wiles of Levee Improved	Construction Completion	Total Budget	Project Description		Planning Unit
										Project Description		
STATE	Chabert Ring Levee	N/A	HP	NA	TERREBONNE	N/A	Not Available	2008	\$500,000	The project consists of the design and construction for a segment of levee around the Chabert Medical Center in Houma, Louisiana. The proposed ring levee will surround the Chabert Medical Center and will provide flood protection for the facility allowing operation during possible flood events.	3A	
STATE	Wine Island	N/A	DM	NA	TERREBONNE	N/A	N/A	2007	\$2,000,000	The purpose of this project was to beneficially use material from the dredging of the Houma Navigation Canal Bay Channel on Wine Island.	3A	
STATE	NRCS Biomass Production Program	N/A	VP	NRCS	COASTWIDE	N/A	N/A	N/A	\$80,000	The NRCS-LDNRCRD Biomass Program is a multi-year programmatic initiative to accelerate the collection, testing, and release of important coastal wetland restoration plants. The Biomass Program began in 1999 in conjunction with the LDNR/CRD Small-Dredge Program with emphasis on plant performance and dedicated dredged sediment. This program is an important coastal restoration initiative that is advancing coastal wetland plant technology development.	COASTWIDE	
STATE	NRCS Biomass Production Program	N/A	VP	NWRCC	COASTWIDE	N/A	N/A	N/A	\$1,562,100	This multi-year cooperative agreement funds the study of endemic wetland plant productivity, with the goal of identifying specific environmental conditions for maximum growth of a number of varieties (i.e., cultivars) within our plant species. The information obtained is intended to facilitate matching plant species and varieties to expected environmental conditions at restoration sites, thereby increasing the likelihood of successful revegetation efforts.	COASTWIDE	
STATE	NRCS Vegetative Planting	N/A	VP	NRCS	COASTWIDE	609	N/A	N/A	\$399,858	This is a coastal vegetative planting program that is implemented annually and involves the installation of vegetative plantings in selected areas where vegetation is needed.	COASTWIDE	
WRDA	Davis Pond Freshwater Diversion	BA-01	FD	USACE	ST CHARLES	33000	N/A	2002	\$120,000,000	The purpose of this project is to maintain and enhance the existing ecological framework of the Barataria Basin by providing freshwater, nutrients, and sediment. This will counter saltwater intrusion and help offset marsh subsidence. This project can divert up to 0.656 cfs.	2	
WRDA	Cajunavon Freshwater Diversion	BS-08	FD	USACE	PLAQUEMINES	16000	N/A	1991	\$24,818,800	This project diverts freshwater and its accompanying nutrients and sediment from the Mississippi River to coastal bays and marshes in Breton Sound for fish and wildlife enhancement. This project can divert up to 8,000 cubic feet per second.	1	

Notes:

Program: CWPRA=Coastal Wetlands Planning, Protection and Restoration Act; State=Restoration projects funded primarily by the State of Louisiana; SECTION 204/1135=Water Resource Development Act Sections 204 and 1135 beneficial use of dredged material projects; WRDA=Water Resources Development Act; CA=Louisiana Coastal Area; FEMIA=Federal Emergency Management Agency funded projects; CLAP 2007=Coral Impact Assistance Program; Surplus 07, Surplus 08, Surplus 09=State surplus-funded projects; Other=funded by programs not otherwise listed.

Agency/Sponsor: BOEMRE=Bureau of Ocean Energy Management, Regulation, and Enforcement; EPA=Environmental Protection Agency; FEMA=Federal Emergency Management Agency; HUD=Housing and Urban Development; NMFS=National Marine Fisheries Service; NRCS=Natural Resources Conservation Service; NWIC=National Wetlands Research Center; USFWS=U.S. Fish and Wildlife Service; USACE=U.S. Army Corps of Engineers; USGS=U.S. Geological Survey.

Project Type: BH=Barrier Island Headland; DM=Beneficial Use of Dredged Material; OM=Oral Management; OT=Other project types (infrastructure, etc.); PP=Property Purchase; SD=Sediment Diversion; SNT=Sediment and Nutrient Trapping; SP=Shoreline Protection; TE=Terraces; VP=Vegetation Planting.

PPL=Priority Project List (as authorized each year by the CWPRA Task Force).

TE-0032-A	North Lake Boudreaux Basin Freshwater Introduction and Hydrologic Management ¹	\$1,268,272	\$15,472,913	\$5,823,553	\$22,564,738
TE-0072	Lost Lake Marsh Creation and Hydrologic Restoration ¹	\$22,487,392	\$1,725,060	\$0	\$24,212,453
Demonstration Projects (P1 & P2)					
LA-0016	Non-rock Alternatives to Shoreline Protection Demonstration	\$3,000	\$0	\$0	\$3,000
Subtotal		\$57,800,381	\$23,504,066	\$6,469,694	\$87,774,141
Adjustment for Outlying Years³		N/A	\$36,495,934	\$53,530,306	\$90,026,240
Total Expenditures		\$57,800,381	\$60,000,000	\$60,000,000	\$177,800,381
Surplus Expenditures⁴		(\$618,683)	\$0	\$0	(\$618,683)
Federal Expenditures (see Note 1)		\$41,667,195	\$43,438,535	\$42,908,859	\$128,014,589
Trust Fund Expenditures		\$15,514,503	\$16,561,465	\$17,091,141	\$49,167,109

Notes:

1- Project is being led by CPRA; projected expenditures include Federal funds; any State expenditures beyond its 15% cost share will be reimbursed by the Federal partners.

2- Project is scheduled to complete construction at end of FY 2015; expenditures for FY 2016 are for project closeout activities.

3- Because CWPPRA projects compete for funding annually, CWPPRA expenditures as presented in Table B-1 (which include projected expenditures for approved projects only) do not adequately capture likely CWPPRA expenditures in outlying years. The State's estimated CWPPRA expenditures for FY 2017 - FY 2018 are therefore based on prior years' expenditures.

4- Used to partially fund construction of BA-0068 (see Table B-6).

Total Expenditures		\$ 216,174,656	\$ 68,260,848	\$ 24,593,938	\$ 309,029,442

Notes:

- 1- Expenditures represent contingency funds to cover post-construction activities.
- 2- Project to receive supplemental funding from CIAP (see Table B-3).
- 3- Surplus funds include post-construction monitoring expenditures (see Table B-9).
- 4- Includes funding for Mid-Barataria Diversion (BA-153; see Table B-15).
- 5- Expenditures will be used for project closeout and potentially to fund additional hurricane protection efforts in the vicinity of the original project.
- 6- Project involves construction of a supplemental project within the scope of original project PO-61 (completed in FY 2011).
- 7- Includes funds that may be used for West Bank and Vicinity (BA-66), HSDRRS Mitigation- West Bank and Vicinity (BA-109), HSDRRS Mitigation- Lake Pontchartrain and Vicinity (PO-121), SELA (PO-57), Permanent Closure of Canals and Pump Stations (PO-60), LPV Task Force Guardian Mitigation- Bayou Sauvage (PO-145), Previously Authorized Mitigation LPV- Manchac (PO-146), Previously Authorized Mitigation- WBV (BA-154), New Orleans to Venice (BA-67), New Orleans to Venice Mitigation- Plaquemines Non-Fed (BA-158), New Orleans to Venice Mitigation- Fed (BA-159), Plaquemines TFU Mitigation- Braithwaite to Scarsdale (BA-156), CRMS-Wetlands, and SWAMP (see Table 4-3).
- 8- Used to partially fund construction of CWPPRA project BA-0068 (see Table B-1).
- 9- Used to partially fund construction of CDBG projects (see Table B-4) and Oil Spill projects (see Table B-15).
- 10- Funds will be used to develop a coordinated strategy for implementing nonstructural projects in coastal communities. This may also include development of pilot projects in coastal parishes with high levels of risk and vulnerability.

Table B-7. CWPPRA Monitoring Projected Expenditures

Project No.	Project Name	FY 2016	FY 2017	FY 2018	Project Total (FY 2016 - FY 2018)

TV-0018	Four Mile Canal Terracing and Sediment Trapping	\$396,538	\$5,194,593	\$7,269	\$5,598,400
TV-0021	East Marsh Island Marsh Creation	\$250,958	\$672,696	\$7,269	\$930,923
TOTAL CWPPRA O&M Expenditures		\$29,320,663	\$22,373,336	\$7,063,942	\$58,757,941
Federal CWPPRA O&M Expenditures		\$24,922,564	\$19,017,336	\$6,004,351	\$49,944,250
State CWPPRA O&M Expenditures		\$4,398,099	\$3,356,000	\$1,059,591	\$8,813,691

Notes:

1. Table shows all approved CWPPRA projects. Demonstration and vegetative planting projects are not shown as they have no O&M budgets. Other projects without O&M budgets have "None" entered in the budget columns. Projects not scheduled to complete within a given year have "Not Constructed" entered in the budget column(s).

2. State share is based on CWPPRA cost share of 85% Federal/15% State except for PPL 5-6 projects, which have a 90% Federal/10% State cost share.

3. Projects that the USACE is responsible for O&M are indicated by (USACE) after the project number.

Table B-11. O&M Projected Expenditures for CWPPRA Projects without Federal Cost Share

Project ID	Project Name	FY 2016	FY 2017	FY 2018	Project Total (FY 2016 - FY 2018)
TE-0020	Isles Dernieres Restoration East Island	\$3,390	\$3,492	\$3,598	\$10,480
TE-0024	Isles Dernieres Restoration Trinity Island	\$3,390	\$3,492	\$3,598	\$10,480

Total Expenditures		\$288,665,547	\$147,574,318	\$87,980,511	\$524,220,376
Surplus Expenditures		(\$16,023,791)	(\$11,359,243)	\$0	(\$27,383,034)
Total State Expenditures		\$272,641,756	\$136,215,075	\$87,980,511	\$496,837,342
Project Generated Adaptive Management (7.5%- RESTORE ONLY)		\$2,704,080	\$2,589,495	\$5,885,562	\$11,179,136

Notes:

1- Red font denotes projected expenditures for which funding has not yet been procured.

2- Projects may be initiated with Trust Fund revenue if available to be reimbursed with oil spill revenues.

3- Expenditures represent early restoration under the Early Restoration Framework Agreement announced on April 21, 2011 and are based on the Louisiana Plan announced by Governor Jindal in July 2011. Negotiations with BP are ongoing and Louisiana expects to receive additional (early and long-term) NRDA funds, but the timing of these funds is highly uncertain. During negotiations it may be determined to advance these projects with oil spill related funding.

4- Project to be implemented by NOAA.

5- Project to be implemented by Louisiana Department of Wildlife and Fisheries (no CPRA funds to be allocated).

6- Project partially funded with surplus funds (see Table B-6).

Appendix C

Barrier Island Status Report

BARRIER ISLAND STATUS REPORT
Draft Fiscal Year 2016 Annual Plan
February 2015

1.0 Introduction

The Coastal Protection and Restoration Authority (CPRA) provides this barrier island status report as part of the Annual Plan document to be submitted to each member of the Louisiana Legislature in compliance with Act 297 of the 2006 Regular Legislative Session. The Act requires that the report: 1) indicate the condition of all barrier islands; 2) provide the status of all barrier island stabilization and preservation projects under construction; and 3) outline future plans for restoration and maintenance of the barrier islands and coastal passes. Because the Annual Plan provides information about all coastal restoration projects in Louisiana (including location, status, features, acres benefited, cost, and funding source), it is appropriate to include a report on the status of the barrier islands.

2.0 Overview of Barrier Islands

The coastline of the modern Mississippi River delta plain is bordered by numerous barrier islands related to several historic major deltaic headlands. For the sake of convenience these islands and headlands can be organized into four distinct barrier systems, each tied to an abandoned Mississippi River delta complex: from west to east they are the Teche, Lafourche, Modern, and St. Bernard delta systems (Figure 1). The back-barrier bays and lagoons are connected to the Gulf of Mexico by numerous tidal inlets, which allow the exchange of diurnal

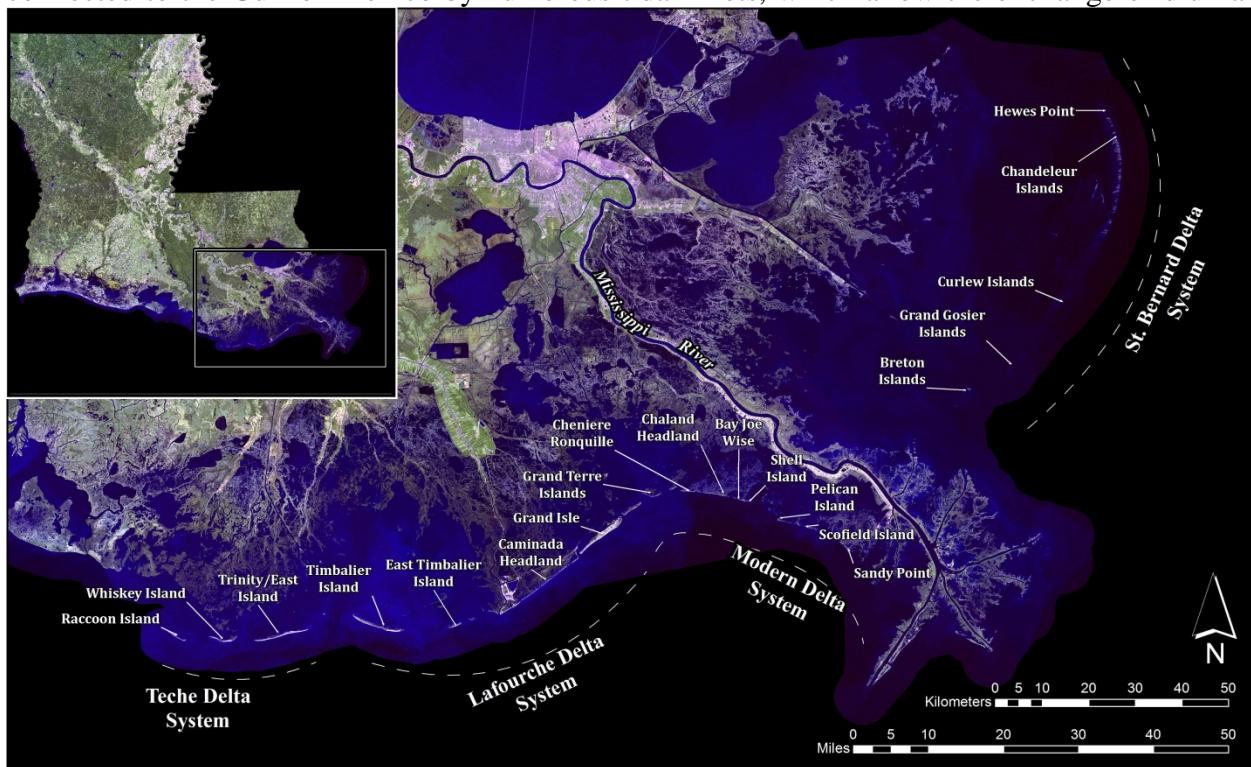

Figure 1. Location of Teche, Lafourche, Modern, and St. Bernard barrier island systems in Louisiana.

tides and separates these barrier islands from each other. The morphology of the barrier islands along the Louisiana coast is related to the sediment supply and physical processes acting in the region (Georgiou et al., 2005). Because barrier islands migrate and deteriorate over time (McBride and Byrnes, 1997), restoration of these habitats requires periodic replenishment of sediment/sand to counteract the losses due to erosion. Numerous hurricanes and the *Deepwater Horizon* oil spill have clearly demonstrated the advantage of robust barrier islands and a well-managed coastline in terms of shoreline resilience and hurricane damage reduction. These events have also highlighted the ecological concerns related to the massive loss of coastal wetland and barrier island systems (Ewing and Pope, 2006). Coastal landscapes created by these barriers can provide a significant and potentially sustainable buffer from wind and wave action as well as storm surges generated by tropical storms and hurricanes. In addition, barrier shorelines are unique habitats that represent the foundation for complex and productive coastal ecosystems.

The restoration of Louisiana's barrier islands has been a priority for a number of programs over the past several decades. In the 1990s, barrier island restoration was a priority for the Coastal Wetlands Planning, Protection and Restoration Act (CWPPRA) program, which funded construction of a number of barrier island restoration projects. More recently, the CPRA has constructed or is planning to construct a large number of additional projects (see below) to restore barrier islands and headlands in coastal Louisiana. The constructed projects have been studied and their performance has been assessed to adaptively improve resilience and persistence of these projects.

More than 20 barrier island projects have been implemented in Louisiana over the past two decades. These projects are described below geographically from west to east, and are grouped by barrier island system.

2.1 Teche Delta System (Raccoon Island to Wine Island)

2.1.1 *Constructed Projects*

1. Raccoon Island Breakwaters Demonstration (TE-29; CWPPRA; 1997) – The goal of this project was to reduce shoreline erosion and increase land coverage. Eight segmented breakwaters were constructed along the eastern end of the island to reduce the rate of shoreline retreat, promote sediment deposition along the beach, and protect seabird habitat. Project effectiveness was determined by monitoring changes in the shoreline, wave energy, and elevations along the beach, and by surveys of the gulf floor between the shoreline and the breakwaters.
2. Raccoon Island Shoreline Protection/ Marsh Creation (TE-48; CWPPRA; 2007, 2013) – The goal of this project was to protect the Raccoon Island rookery and seabird colonies from an encroaching shoreline by reducing the rate of erosion along the western end of the island and creating more land along the northern shoreline. This goal was accomplished through the construction of eight additional breakwaters west of the existing (TE-29) breakwaters and a terminal groin at the eastern of the island (Phase A). In addition, mixed sediment from an offshore borrow site in federal waters was dredged to create 60 acres of back barrier marsh platform with an average elevation of 3.5 feet (Phase B). The shoreline protection (Phase A)

- component of this project was constructed in 2007; construction of the back barrier marsh platform component (Phase B) was completed in April 2013.
- 3. Whiskey Island Restoration (TE-27; CWPPRA; 1999) – The objective of this project was to create and restore beaches and back barrier marsh platform on Whiskey Island. About 4.6 miles of the Gulfside shoreline with beach/dune component of variable width (700-800 feet) was restored using about 2.9 million cubic yards (MCY) of sand. The dune height was 4 feet with crest varying from 300-500 feet. The project consisted of creating 523 acres of back barrier marsh platform and filling in the breach at Coupe Nouvelle. The initial vegetation planting of smooth cordgrass (*Spartina alterniflora*) on the bayside shore was completed in July 1998 and additional vegetation seeding and planting was carried out in spring 2000.
 - 4. Whiskey Island Back Barrier Marsh Creation (TE-50; CWPPRA; 2009) – The goal of the TE-50 project was to increase the longevity of the previously restored and natural portions of the island by increasing the island's width which helped retain sand volume and elevation. Approximately 316 acres of back barrier intertidal marsh habitat, 5,800 linear feet of tidal creeks, three 1-acre tidal ponds and 13,000 linear feet of protective sand dune were created by semiconfined disposal and placement of dredged material. About 2.76 MCY of mixed sediment was dredged from an offshore borrow area in Gulf of Mexico near the island. After removal of the mixed sediment overburden, about 0.36 MCY of underlying sand was used to create the dune fronting the marsh platform. The vegetative planting with native marsh vegetation to colonize and protect the newly-placed marsh soil was undertaken.
 - 5. Isles Dernieres Restoration Trinity Island (TE-24; CWPPRA; 1999) – The project objectives included the restoration of the dunes and back barrier marshes of Trinity Island. Approximately 4.85 MCY of sand/sediment were dredged from a borrow area in Lake Pelto to build approximately 4.3 miles of 8-feet high dune with crest width of about 300 feet along with an elevated marsh platform at the bay side of the island. A total of about 353 acres of supratidal and intratidal habitats were created. About 22,500 feet of sand fences were installed in various orientations along with vegetative planting to stabilize the sand and minimize wind-driven transport.
 - 6. New Cut Dune and Marsh Restoration Project (TE-37; CWPPRA; 2007) – The purpose of this project was to close the breach between Trinity and East Islands through the creation of beach, dune, and marsh habitats in order to increase the structural integrity of eastern Isles Dernieres by restoring the littoral drift and adding sediment into the nearshore system. New Cut was closed through the construction of about 8,000 feet of dune platform (by placing approximately 0.85 MCY of sand dredged from an offshore borrow area) matching the dune elevations on the east and west, strengthening the connection between East and Trinity Islands. Nine species of native barrier island vegetation were planted along with over 17,000 linear feet of sand fence.
 - 7. Isles Dernieres Restoration East Island (TE-20; CWPPRA; 1999) – The project objective was to restore the coastal dunes and wetlands of the Eastern Isles Dernieres. Approximately 3.9 MCY of sand were dredged from Lake Pelto to build about 353 acres of beach and dune with target elevations of 2 feet and 8 feet, respectively. The dune crest width ranges from 300 to 500 feet. Sand fences and vegetation were also installed to stabilize the sand and minimize wind-driven transport.
 - 8. Enhancement of Barrier Island Vegetation Demonstration (TE-53; CWPPRA; 2010) – The goal of this project was to test several technologies or products to enhance the establishment and growth of key barrier island and salt marsh vegetation. The project focuses specifically

on enhancing the establishment and growth of transplants of both dune vegetation (*Panicum amarum* and *Uniola paniculata*) and marsh vegetation (*Spartina alterniflora* and *Avicennia germinans*). Planting took place on Whiskey Island and New Cut in 2010, and monitoring of vegetation began in 2011.

2.1.2 Projects under Construction

None.

2.1.3 Future Projects

1. NRDA Caillou Lake Headlands Restoration Project (TE-100; NRDA): This project includes the project area as envisaged by previous CWPPRA project entitled “Ship Shoal: Whiskey West Flank Restoration (TE-47)”. The design template of this project is same as that suggested under the Louisiana Coastal Area (LCA)- Terrebonne Basin Barrier Shoreline (TBBS) Restoration Project, which includes the entire island footprint. This project will provide a barrier to reduce wave and tidal energy, thereby protecting the mainland shoreline from continued erosion. The objective of this project is to rebuild dunes and a marsh platform on the Whiskey Island through the emplacement of about 8.9 MCY of sand transported from Ship Shoal Block 88. About 4.26 miles of shoreline will be nourished with a 6.4 feet high and 100 feet wide dune crest and 4.2 feet high and 464 feet wide beach on Gulf side and 100 feet wide on Bay side, covering around 1,063 acres. About 0.82 MCY of sediment would be used to construct 178 acres of marsh platform. NRDA funds will be used for construction of this project.

2.2 Lafourche Delta System (Timbalier Island to Grand Isle)

2.2.1 Constructed Projects

1. Timbalier Island Planting Demonstration (TE-18; CWPPRA; 1996) – For this project, sand fences were installed and vegetation suited to the salinity and habitat type of Timbalier Island was planted in several areas on the island to trap sand and buffer wind and wave energy.
2. Timbalier Island Dune and Marsh Creation (TE-40; CWPPRA; 2004) – Timbalier Island is migrating rapidly to the west/northwest; therefore, the western end of Timbalier Island is undergoing lateral migration by spit-building processes at the expense of erosion along the eastern end. The objective of this project was to restore the eastern end of Timbalier Island by restoring beach, dunes, and marsh. An 8-foot high dune with average crest width of about 400 feet was built using about 4.6 MCY of sand/sediment dredged from offshore borrow area which created a total fill area of about 273 acres, including about 196 acres of marsh platform.
3. East Timbalier Island Sediment Restoration, Phase 1 (TE-25; CWPPRA; 2000) – The objective of this project was to strengthen and thus increase the longevity of East Timbalier Island. The project included the placement of dredged sediment in three embayments along the landward shoreline of East Timbalier Island, along with aerial seeding of the dune platform, installation of about 13,000 linear feet of sand fencing, and dune vegetation plantings. About 2.8 MCY of sediment was dredged from an offshore borrow area to create a total of about 217 acres of supratidal and intratidal habitats which included a 5-foot high

dune with crest width of about 200 feet and a 2-foot high and 500-foot wide marsh platform. This project was funded over two funding cycles, PPL 3 and 4, from 1999 and 2000, respectively.

4. East Timbalier Island Sediment Restoration, Phase 2 (TE-30; CWPPRA; 2000) – The project goals and objectives were the same as that of Phase 1. While Phase 2 of the project along the western half of the island did not reconnect the western and eastern portions of the island, it did create 99% of the targeted acreage. It has helped to protect thousands of acres of existing fringing marsh to the north. Construction funds from this phase of the project were also used for 7,000 feet of rubble mound revetment created to protect the newly created habitats.
5. West Belle Pass Barrier Headland Restoration (TE-52; CWPPRA; 2012) – The goals of this project were to re-establish the eroded West Belle Pass headland via dune and marsh creation and to prevent increased erosion along the adjacent bay shoreline, protect the interior marshes and the Port Fourchon area. The project created a continuous headland approximately 10,660 feet in length, creating about 93 acres of dune habitat using nearly 1.74 MCY of dredged sand, and about 227 acres of marsh habitat using 3.05 MCY of dredged mixed sediment. Construction began in May 2011 and completed in 2012.
6. Bayside Segmented Breakwaters at Grand Isle (BA-50; CIAP; 2012) – The purpose of this project was to reduce erosion on the bay side of Grand Isle. Twenty-four 300 foot breakwaters (approximately 1.5 miles) were constructed on the back-bay side of Grand Isle. This project was constructed with Jefferson Parish CIAP funds in September 2012.

2.2.2 Projects under Construction

1. Caminada Headland Beach and Dune Restoration (BA-45; CIAP; Surplus) – The Caminada Headland Beach and Dune Restoration project will restore and maintain the headland through the creation of dunes and beach habitat and will protect unique coastal habitats, continue littoral sand transport to Grand Isle, and protect Port Fourchon and the only hurricane evacuation route available to the region. This reach of the Barataria shoreline also supports the only land-based access to the barrier shoreline in the Deltaic Plain. Construction of portions of the Caminada Headland component of the LCA-BBBS Restoration Project template began in early 2013 using CIAP 2007 and Surplus 2008 funds. Approximately 3.3 MCY of sand from South Pelto Blocks 12 and 13 borrow area (eastern portion of Ship Shoal Complex) was placed to restore approximately 6 miles of shoreline by constructing a 7-foot high and about 290-foot wide dune and a 4.5-foot high and 65-foot wide beach over a surface area of about 303 acres. This restoration project is unique in that it is the first time that sand from the Ship Shoal complex was dredged for coastal restoration purposes and was transported a distance of almost 22 miles.
2. Caminada Headland Beach and Dune Restoration Increment II (BA-143, NFWF) – In order to achieve the goals of this project approximately 5.39 MCY of sand will be dredged from the South Pelto Block in Ship Shoal and construct a 7-foot high dune with a 290 foot width along with a 4.5-foot high and 65-foot wide beach over a project length of 39,000 linear feet thereby restoring the headland on the same template as BA-45. This project will start approximately in the middle of the headland, where the BA-45 project ended and continue east to Caminada Pass. It is expected to create a surface area of about 489 acres. Construction of the project is anticipated to begin in the spring of 2015 and be complete by the end of 2016. When complete the BA-45 and BA-143 projects will have pumped over 8.5 million cubic yards onto the headland to restore over 13 miles of beach and dune habitat.

2.2.3 Future Projects

1. East Timbalier Island Restoration Project (TE-118; NFWF) – East Timbalier Island is part of a barrier island chain that separates Terrebonne and Timbalier Bays from the Gulf of Mexico. The island is currently comprised of two severely degraded segments. This project is for engineering and design to develop a final design package consisting of permitting, WVA assessment, and construction plans and specifications – with probable construction cost and schedule, all sufficient to re-establish the historic island footprint, reconnecting the two segments, with restoration of dune, supratidal, and intertidal habitat. Estimated Benefits (East Timbalier Plan B) include in TY1 Beach/Dune Minimum Template – 241 acres and Intertidal Marsh – 279 acres.
2. Caminada Headlands Back Barrier Marsh Creation Project (BA-171; CWPPRA) – This project would create 300 acres of back barrier intertidal marsh and nourish 130 acres of emergent marsh behind 3.5 miles of Caminada Beach using 2.7 MCY of mixed sediment dredged/ pumped from delineated borrow area in the Gulf of Mexico. The marsh creation and nourishment cells are designed to minimize impacts on existing marsh and mangroves. Assuming some natural vegetative recruitment, vegetative plantings are planned at a 50% density, with half planned at Target Year 1 (TY1) and half planned at TY3. This project (BA-171) will be designed to create and nourish marsh habitat behind BA-45 to further decrease the likelihood of breaches and improve the longevity of the shoreline. BA-171 is a CWPPRA project which is funded for E&D (Phase 1).
3. Barataria Basin Barrier Shoreline (BBBS) Restoration (LA-10; LCA) – Initially this project included the Caminada Headland Beach and Dune Restoration and Shell Island Restoration Projects. Portions of Caminada Headland were constructed with CIAP and Surplus funds. The eastern beach/dune portion will be constructed with NFWF funds, and a portion of the back barrier marsh platform is being designed through CWPPRA. Shell Island East was constructed with Berm to Barrier Funds, and Shell Island West will be constructed with NRDA funding. Construction of the remainder of the BBBS template features will be decided at a later date.

2.3 Modern Delta System (Cheniere Ronquille to Scofield Island)

2.3.1 Constructed Projects

1. Vegetative Plantings of a Dredged Material Disposal Site on Grand Terre Island (BA-28; CWPPRA; 2001) – The goal of this project was to stabilize dredged material sites on West Grand Terre Island. This objective was achieved through vegetation plantings and by purchasing grazing rights on the island for the 20-year life of the project.
2. East Grand Terre Island Restoration (BA-30; CIAP; 2010) – The goal of this project was to stabilize and benefit 1,575 acres of barrier island habitat and extend the island's life expectancy by filling breaches and tidal inlets in the shoreline, and reinforce the existing shoreline with sand. For this about 621 acres of barrier island were created by restoring 2.8 miles of barrier shoreline through construction of a 6-foot high dune along with 165 acres of beach habitat and construction of about 456 acres of marsh platform using about 3 MCY of sand and 1.6 MCY of mixed sediment from two offshore borrow areas. Although the CPRA

constructed this projects using CIAP 2007 funds, this project was engineered, designed, permitted, and received the necessary land rights for construction, through the CWPPRA program, in partnership with the NOAA Fisheries.

3. Barataria Barrier Island Complex Project: Pelican Island and Pass La Mer to Chaland Pass Restoration (BA-38; CWPPRA; 2007, 2012) – The objectives of this project were to create barrier island habitat, enhance storm-related surge and wave protection, prevent overtopping during storms, and increase the volume of sand within the active barrier system. This project includes restoration of two barrier islands viz. the Chaland Headland portion of this project, which was constructed in 2007, and the Pelican Island segment, which began construction in May 2011 and was completed in 2012. Additionally in June 2010, the state began construction of a barrier berm in response to the *Deepwater Horizon* oil spill from Shell Island to Scofield Island west of the river to safeguard its coast from the effects of the oil. The construction of the berm introduced a significant amount of sand into the barrier island system.
 - a. Pass La Mer to Chaland Pass Restoration (BA-38-1; CWPPRA; 2007) – A total fill area of 484 acres was created which included about 254 acres of back barrier marsh platform with an average elevation of 2.5 feet. Back barrier marsh platform was constructed using about 1.0 MCY of overburden mixed sediment from an offshore borrow area. About 2.4 MCY of sand was placed to build about 230 acres of beach-dune habitat with a dune height of 6 feet and crest width of 400 feet over a project length of 2.7 miles.
 - b. Pelican Island Restoration Project (BA-38-2; CWPPRA; 2012) – Pelican Island was restored using about 6.4 MCY of mixed sediment and sand from 4 different borrow areas in state and federal waters ranging in distance from 2 to 12 miles. About 2.1 MCY (in-place volume) of sand were utilized to create 192 acres of beach-dune habitats. About 398 acres of marsh platform, with an average elevation of about 2.6 feet, was constructed using 1.6 MCY of sediment. Average dune elevation was about 7.5 feet extending to a length of 2.5 miles. It may be noted that Emergency Berm W9 was built in front of this island using about 1.24 MCY of sand.
4. Pass Chaland to Grand Bayou Pass Barrier Shoreline Restoration (BA-35; CWPPRA; 2009) – Also known as Bay Joe Wise, this project includes the emplacement of mixed sediment to create marsh along with tidal creeks and ponds, followed by vegetation plantings. The project's objectives were to: 1) prevent the breaching of the Bay Joe Wise shoreline by increasing barrier shoreline width; 2) increase back-barrier, emergent marsh area by approximately 220 acres to maintain the barrier shoreline; and 3) create emergent marsh suitable for tidal aquatic habitats. These features act as a buffer against wave and tidal energy, thereby protecting the mainland shoreline from breaching and continued erosion. About 350 acres of total fill area was created which included a marsh platform approximately 1,000 feet wide contiguous with the northern side of the gulf shoreline of Bay Joe Wise. The dune was built to an elevation of 6 feet with a dune crest width of about 110 feet. Approximately 3 MCY of sediment was dredged from the Pas la Mer Ebb-Tide Delta, Pass Chaland Ebb-Tide Delta, and Grand Pass Ebb-Tide Delta. The project also included the construction of approximately 10,000 feet of 4-foot wide, 2-foot deep tidal creeks or water exchange channels. In addition, immediate post-construction aerial seeding with Japanese millet (*Echinochloa frumentacea*) or brown top millet (*Panicum ramosum*) followed by smooth cordgrass (*Spartina alterniflora*) and black mangrove (*Avicennia germinans*) vegetative plantings were undertaken.

5. Riverine Sand Mining/Scofield Island Restoration (BA-40; Berm Funds; 2013) – The goals of this project were to mitigate breaches and tidal inlets in the shoreline, reinforce the existing shoreline with sand, increase the width of the island with back barrier marsh to increase island longevity, and to re-establish a sandy dune along the length of the shoreline to protect the back barrier marsh platform from sea level rise and storm damage. The beach-dune habitats were constructed by the sand dredged from a borrow area in the Lower Mississippi River via a 22-mile long pipeline and the marsh platform was constructed from an offshore borrow source of mixed sediment. Although this project was designed under CWPPRA, construction began in December 2012 using Berm Funds. This created approximately 2.16 miles of beach and dune fill to close the breach areas and restore/protect the eroding beach. The dune component included a 50-foot wide crest width at +6 feet NAVD88. The beach fill template included a 100-foot wide construction berm at +4 feet NAVD88. The surface area of the beach platform was approximately 223 acres measured at +4 feet NAVD88. The required fill volume was approximately 2.03 MCY (required excavation (cut) volume was approximately 2.64 MCY). An approximately 2.23-mile long back barrier marsh platform on the bay side of Scofield Island was constructed. The surface area of the proposed marsh platform is approximately 375 acres with target marsh platform elevation of +3.0 feet NAVD88. The required fill volume was approximately 1.74 MCY (the required excavation (cut) volume is approximately 2.79 MCY). It may be noted that Emergency Berm W-10 was built in front of this island using about 0.964 MCY of sand.
6. Western Berm Reaches (West of Mississippi River along Shell, Pelican and Scofield Islands)
In response to the *Deepwater Horizon* oil spill which began on April 20, 2010, the State of Louisiana constructed approximately 16 miles of sand berms along several sections of the state's barrier islands both east and west of the Mississippi River. The objective of these projects was to provide a barrier to oil and minimize the potential impact of the oil spill to thousands of acres of fragile barrier islands and wetlands in coastal Louisiana.
 - a. Berm Reach W8 (Shell Island): The initial template of berm reach W8 was located within the footprint of the Shell Island restoration project which was proposed under the Barataria Basin Barrier Shoreline LCA project. However, pre-construction surveys indicated that the island had receded, so the profile was shifted approximately 750 feet north. The construction template for the W8 berm reach was identical to the templates used on the other berm reaches: a 20-foot crest width, +5 feet, NAVD 88 crest elevation, 1V:25H side slopes above -2.0 feet, NAVD88 and 1V:50H below -2.0 feet, NAVD 88. Construction of approximately 9,000 linear feet of berm on Shell Island started on October 9, 2010 and was completed by November 23, 2010. Approximately 777,000 cubic yards of sand was placed along the island.
 - b. Berm Reach W9 (Pelican Island): Construction of berm reach W9 along Pelican Island started on July 18, 2010 and was completed by October 2, 2010. Sand was placed within the construction template, which was identical to the template used for the other berm reaches. The template was superimposed on the existing island and within the footprint of the proposed CWPPRA Pelican Island Restoration Project (BA-38-1). A total length of 12,700 feet of berm was constructed and approximately 1,294,000 cubic yards of sand was emplaced within the berm along Pelican Island.
 - c. Berm Reach W10 (Scofield Island): Construction of berm reach W10 on Scofield Island started on September 13, 2010. Approximately 935,000 cubic yards of sand was placed between September 13 and November 23, 2010 for constructing approximately 14,755

feet of berm. The construction template for berm reach W10 was identical to the other berm reaches. The berm was constructed within the footprint of the proposed CWPPRA Scofield Island Restoration Project (BA-40).

7. Shell Island Restoration – Shell Island is a critical component of the Barataria shoreline which has been breached into two islands – east and west. Restoration of these two islands was initially included in the LCA-BBBS Project. The Shell Island Restoration project would restore this barrier island through the creation of dune and marsh habitat. The overall goals of this project are to prevent intrusion of the Gulf of Mexico into interior bays and marshes, restore natural sand transport along this reach of the coast, and protect oil and gas facilities. This segment of the shoreline has been nearly lost. It may be noted that Emergency Berm Reach W8 was built using about 0.777 MCY of sand on the eastern portion of the Shell East island. This project has been split into two projects: Shell Island East-Berm (BA-110) and Shell Island West NRDA (BA-111). Shell Island East (Berm) has been constructed, whereas Shell Island West NRDA is funded through the Louisiana Outer Coast Restoration project using NRDA Early Restoration Funds.
 - a. Shell Island East Berm (BA-110) was constructed between April 2013 and August 2013. About 2.29 MCY of sand from a Lower Mississippi River Borrow Area (the same borrow area used for the Scofield Restoration Project [BA-40]) was utilized to construct an 8-foot NAVD 88 dune with a crest width of 340 feet between station 76+79 and station 144+00 creating a dune area of about 87 acres as well as a beach area of approximately 54 acres. About 136 acres of marsh platform was constructed using about 0.286 MCY from the same borrow area as the dune sediment.

2.3.2 Projects under Construction

None.

2.3.3 Future Projects

1. Cheniere Ronquille Barrier Island Restoration (BA-76; NRDA) – This project would expand the Cheniere Ronquille's gulf shoreline structural integrity by tying into two recently constructed projects to the east and address one of the remaining reaches of the Barataria/Plaquemines shoreline. The design includes fill for a beach and dune plus 20 years of advanced maintenance fill, as well as fill for marsh creation/nourishment. Approximately 127 acres of beach/dune fill would be constructed and approximately 259 acres of back barrier marsh platform would be constructed using the sand/sediment from the borrow areas identified for earlier projects. Once restored, this island will provide critical habitat, and help reconnect the barrier island chain that provides defense to inland communities. Dune plantings would be conducted by seeding and installing approved nursery stock. About half of the marsh platform would be planted with cordgrass and portions of the dune, swale, and marsh would be planted with appropriate woody species. This project will be built by the National Marine Fisheries Services and is funded through the Louisiana Outer Coast Restoration project using NRDA Early Restoration Funds.
2. Shell Island West (BA-111: NRDA): This project is in the final design phase. The template of this project includes 16,100 feet of shoreline with an 8-foot high and 340-foot wide dune on the western portion of the east island, and a 380-foot wide dune on the western island,

creating an area of about 231 acres with 4.8 MCY of sand. About 285 acres of barrier marsh platform will be constructed using about 1.1 MCY of mixed sediment from an offshore borrow area. This project is funded through the Louisiana Outer Coast Restoration project using NRDA Early Restoration Funds.

2.4 St. Bernard Delta System

2.4.1 *Constructed Projects*

1. Chandeleur Islands Marsh Restoration (PO-27; CWPPRA; 2001) – This project is intended to accelerate the recovery period of barrier island areas overwashed by Hurricane Georges in 1998 through vegetation plantings. The overwash areas, which encompass 364 acres, are located at 22 sites along the Chandeleur Sound side of the island chain and were planted with smooth cordgrass (*Spartina alterniflora*).
2. Eastern Berm Reach E4 (East of Mississippi River along Chandeleur Islands): In response to the *Deepwater Horizon* oil spill which began on April 20, 2010, the State of Louisiana constructed approximately 16 miles of sand berms along several sections of the state's barrier islands both east and west of the Mississippi River. The objective of this project was to provide a barrier to oil and minimize the potential impact of the oil spill to thousands of acres of fragile barrier islands and wetlands in coastal Louisiana. A total of 47,000 feet (8.9 miles) of berm were constructed along the Chandeleur Islands. It was estimated that a total of 5.85 MCY of sand was dredged from Hewes Point.

2.4.2 *Projects under Construction*

None.

2.4.3 *Future Projects*

1. Louisiana Outer Coast Restoration Project: North Breton Island (NRDA) – Funded as an Early NRDA Restoration Project, the Louisiana Outer Coast Restoration project comprises four island segments including Breton Island. The goals of this project are to restore beach, dune, and back-barrier marsh habitats, as well as habitat for brown pelicans, terns, skimmers, and gulls to help compensate the public for spill-related injuries and losses to these resources. The restoration work involves placement of appropriately sized sediments to create beach, dune, and back-barrier marsh areas; installation of sand fencing to trap and retain windblown sediments and foster dune development; and revegetation of appropriate native species in dune and back-barrier marsh habitat.

3.0 **Monitoring and Maintenance**

Louisiana's barrier islands are part of a complex system controlled by many overlapping and interrelated processes. The four primary barrier island systems have been monitored and evaluated by recent efforts, such as the Barrier Island Comprehensive Monitoring (BICM) program (Section 3.1) and the monitoring of the Emergency Berms (Section 3.2). In addition to the monitoring, the Barrier Island Maintenance Program (BIMP; Section 3.3) provides a

framework for prioritizing planning, design, and construction of barrier island maintenance projects when needs are identified. These programs have provided information to the CPRA regarding the current condition and stability of Louisiana's barrier islands. To minimize the acceleration of island disintegration that commonly occurs after islands breach, a barrier island Breach Management Program is currently being developed to address both breach prevention and response to breaches when they occur (Section 3.4). This program will drastically improve the state's ability to repair storm-induced damages and extend the life-expectancy and integrity of Louisiana's barrier shorelines. Finally, to ensure the efficient and effective use of limited sediment resources in Louisiana, a Borrow Area Monitoring and Maintenance (BAMM) project has been initiated to provide information to understand the evolution of the borrow pits (inland, riverine, and offshore) over time, especially the infilling characteristics (rate and types of sediment) and gradient of the pit-slopes (Section 3.5).

3.1 Barrier Island Comprehensive Monitoring (BICM) program

The development of a comprehensive program to evaluate the state's barrier shoreline was initiated by a Louisiana Department of Natural Resources (LDNR) workgroup (now headed by the CPRA) in 2002-03. This workgroup developed a monitoring framework to assess shoreline processes and resulting habitats, and the changes in these ecosystems over time. The initial plan was then reviewed in 2004 by the Louisiana Shoreline Science Restoration Team (SSRT) working under the LCA program. The LCA study recommended the establishment of a coordinated System-wide Assessment and Monitoring Program (SWAMP), which would integrate the environmental monitoring of wetlands (Coastwide Reference Monitoring System, or CRMS-Wetlands), rivers and inshore waters (CRMS-Waters), near-shore waters, and barrier islands (BICM). The initiation of the BICM program in 2005 was conducted through the CPRA and was funded by the LCA Science and Technology (S&T) office and through a partnership between the University of New Orleans (UNO) and the U.S. Geological Survey (USGS). Initial goals of the BICM program were to establish baseline conditions for the state's barrier shoreline after hurricanes Katrina and Rita, as well as to refine the methods and products for use in programs other than LCA (e.g., CWPPRA; CIAP; BIMP).

The advantage of BICM over CWPPRA project-specific monitoring alone, is the ability to provide integrated long-term data on all of Louisiana's barrier shorelines, instead of only those areas with constructed projects. As a result, a greater amount of long-term data are now available to evaluate constructed projects, facilitate planning and design of future barrier island projects, assist operations and maintenance activities, and determine storm impacts. Because data were collected for the entire barrier island system concurrently, BICM data are more consistent and complete than previous barrier island data collection efforts.

Initial BICM datasets collected include 1) post-storm damage assessment photography and videography, 2) shoreline position, 3) land/water analysis, 4) topography, 5) bathymetry, 6) habitat composition, and 7) surficial sediment composition. Additionally, these datasets have been compared to historic datasets (where available) that have been standardized, thereby providing digital datasets to user groups for their use in multiple restoration efforts. Data collection for all seven BICM components initiated in 2005 was completed in 2008. Final datasets and reports are currently available through the CPRA web site.

Post-storm assessment products included an aerial video survey of the entire coastline and photographs of the majority of the shoreline. Photography of particular shoreline locations were then matched with historic photographs to provide time-series datasets for shoreline evaluations and comparisons (Figure 2).

These datasets have already proven invaluable in assessment of the impacts of Hurricanes Gustav and Ike in 2008, in the planning of LCA projects currently in the feasibility stage, and in the *Deepwater Horizon* oil spill of 2010. These photos have also allowed assessment of impacts for documentation of damage claims to FEMA.

A combination of CRMS-Wetlands, UNO photography, and Quickbird satellite imagery was collected for the entire Louisiana coast. Shoreline positions using post-storm photography have been developed along with complete 1880s, 1930s, 1990s, and 2004 shorelines. The imagery has been analyzed, and datasets for historic, long-term, short-term, and near-term erosion rates for the entire coastline are available (Figure 3). Additionally, land/water change maps and tables have been developed with the shoreline changes (Figures 4 and 5).

LiDAR data have been collected for all three portions of the sandy coast; the Chandeleur Islands, from Raccoon Island to Sandy Point, and the Chenier Plain from Sabine Pass to the Mermentau River Outlet. Data, grid models, and change models for all coastal areas are complete (Figure 6). USGS has continued to fly LiDAR for the Chandeleur region and has provided an additional four surveys of the area (Figure 7). Additionally, LiDAR was flown by USGS for the Teche and Lafourche Deltaic Regions in early 2008 and plans are underway to bring these data into the BICM program for use. LiDAR data were acquired from the Caminada Headland to Sandy Point in March, 2013 as part of a lower Barataria basin LiDAR update through a partnership with USGS. The processed data is scheduled for delivery from USGS in early 2014.

Bathymetric surveys were conducted during 2006 and 2007. The Chenier plain area and the southern Chandeleur Islands were surveyed to complete the coast-wide coverage areas begun in 2006. Surveys covered from five kilometers (km) offshore to two km bayward of the shoreline. In addition to bathymetry data, USGS collected sonar and seismic data along all the offshore lines and did a complete sidescan sonar mosaic of the gulf side of the Chandeleur Islands. Data, grid models, and change models from all field work are finalized (Figures 8, 9, and 10).

Figure 2. Photo comparison of Elmer's Island shoreline in Lafourche Parish, LA immediately after Hurricanes Katrina and Rita in 2005, and approximately 2 years later.

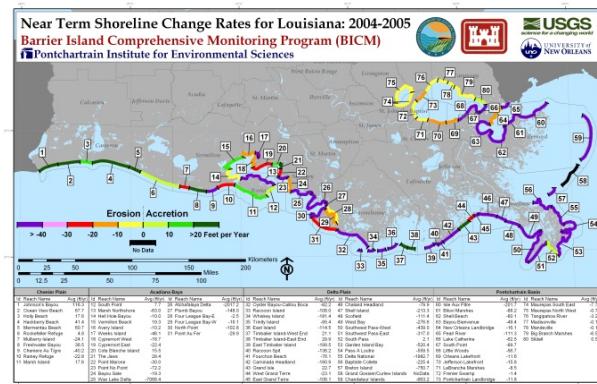

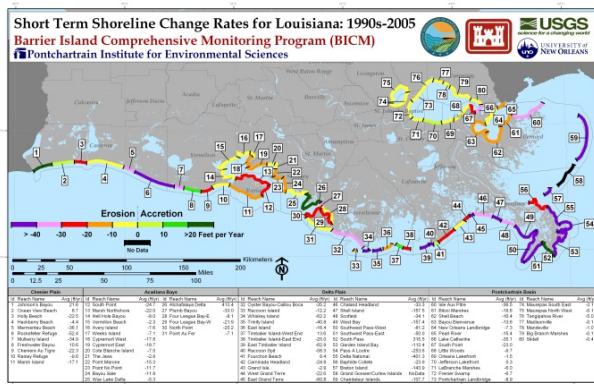

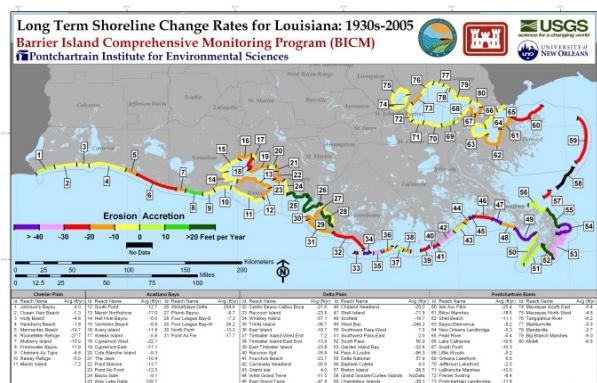

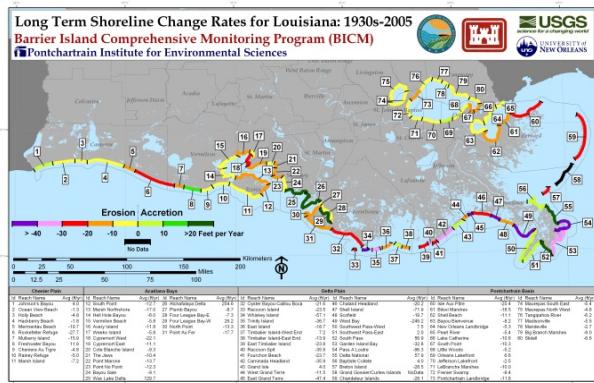

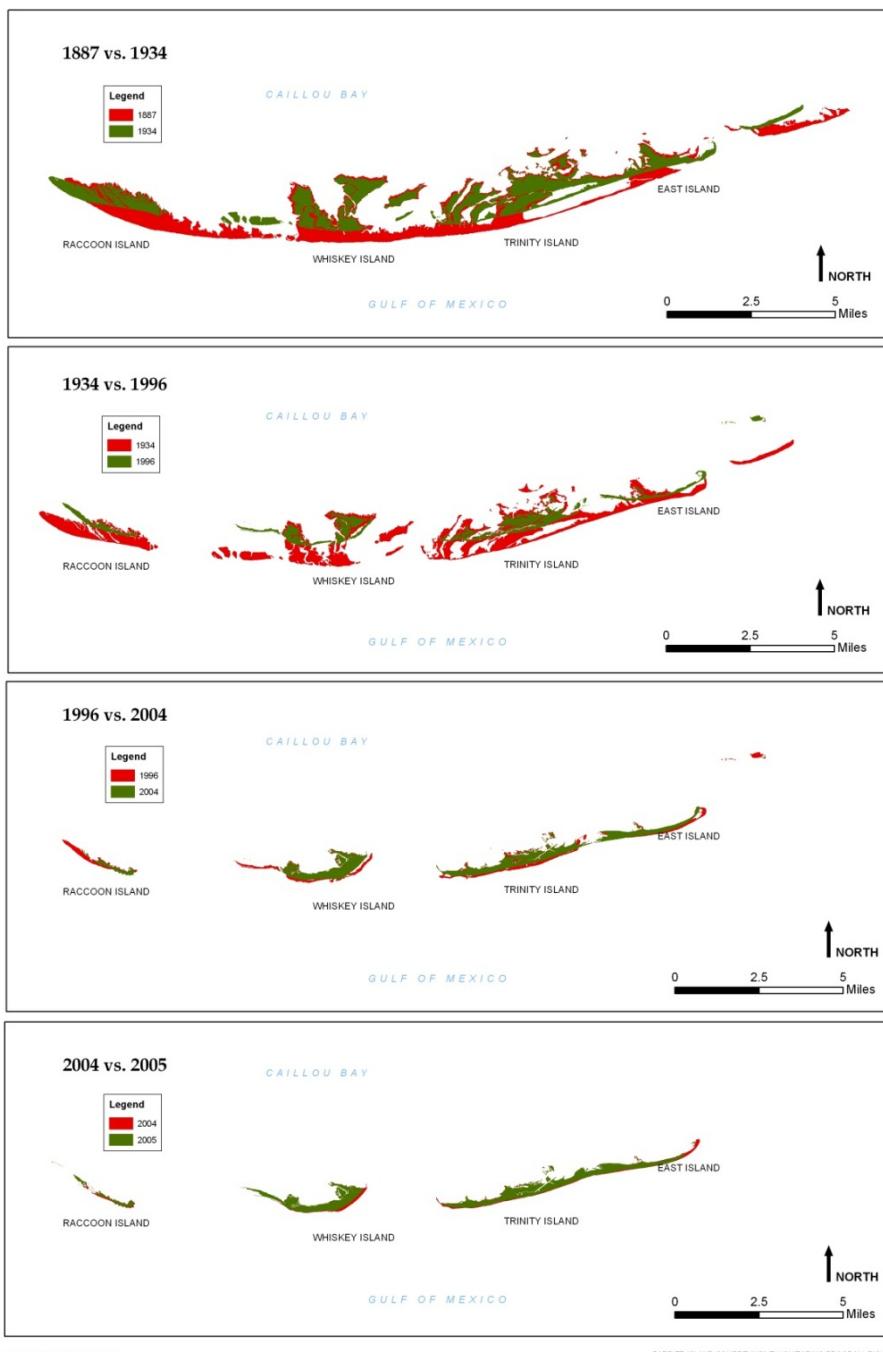

Figure 3. Shoreline erosion rates for sections of the Louisiana coast. A) Historic (1850s-2005), B) Long-term (1920s–2005), C) Short-term (1996-2005), and D) Near-term (2004-2005) (Martinez et al., 2009).

Habitat analysis based on the aerial photography is complete. Detailed habitat data for all BICM shoreline areas are available for 1996/98, 2002, 2004, and 2005 along with change maps showing habitat differences for all time periods (Figures 11 and 12).

Collection of surficial sediments for sediment characterization was conducted in 2008 and analysis is complete. Sediment characterization analysis, reports, and distribution maps are available (Figure 13).

A final report entitled “Louisiana Barrier Island Comprehensive Monitoring (BICM) Program Summary Report: Data and Analyses 2006 through 2010: U.S. Geological Survey Open-File Report 2013–1083” was published as a USGS open file and can be accessed online at <http://pubs.usgs.gov/of/2013/1083/> (Kindinger et al., 2013). The BICM program used both historical and newly acquired (2006 - 2010) data to assess and monitor changes in the aerial and subaqueous extent of islands, habitat types, sediment texture and geotechnical properties, environmental processes, and vegetation composition. BICM datasets included aerial still and video photography (multiple time series) for shoreline positions, habitat mapping, and land loss; LiDAR surveys for topographic elevations; single-beam and swath bathymetry; and sediment

grab samples. Planning and design of the program will continue to refine future data collection, analysis, products, tools, and timelines for future programmatic monitoring.

CIAP funded monitoring of vegetation on some barrier island projects will be used to refine vegetative sampling procedures proposed in the original 2003 BICM proposal document. These vegetative sampling procedures will be conducted and analyzed to determine the added value of vegetative sampling within the BICM program, and potential costs of full-scale implementation. Once this analysis is completed, decisions will be made whether to incorporate this additional BICM component as originally recommended.

The USGS Coastal and Marine Science Center (St. Petersburg, FL) completed a final BICM report in 2013 (Kindinger et al., 2013) synthesizing the findings covering all aspects of the initial BICM program and held a workshop to report findings and discuss future efforts. Stakeholders participated in discussions of results and identified additional future needs such as overwash, subsidence, and storm impacts, within the context of a long-term monitoring program. The report is available digitally via the CPRA or USGS websites and presents the data collection efforts, as well as discusses several broad scale issues synthesizing the BICM data as a basis for assessments. Various themes discussed include shoreline change within the context of sea-level rise, hurricane impacts and island response, tidal inlet management, habitat changes, and future BICM goals. The report provides not only an overview of the data collection efforts, but also

provides an initial overview of issues addressed by the data, as well as additional stakeholder needs.

The next BICM data collection cycle (2013-2017) has been initiated with the revisions and development of shoreline position data and the addition of shorelines for the 1950s, 2008, and 2012. These data will be available within the next six months and provide updated shoreline erosion data, including added time periods to better evaluate changes in shoreline position. BICM is currently moving to capture other data sets in the Teche, Lafourche, and Modern Deltas, and Chandeleurs in 2015, and then move through data collection efforts in the Chenier Plain (2016), with data synthesis and delivery in 2017.

Data collection activities for the other BICM datasets are being planned with USGS and other contractors to reoccupy the original BICM data locations for comparisons, as well as provide some added coverage areas based on stakeholder needs (Western Chenier Plain). Efforts are continuing to contract USGS for topographic LiDAR surveys of the Teche Delta region in early 2015. USGS has already conducted LiDAR surveys of the Lafourche and Modern Delta BICM areas in 2013 through other efforts of the CPRA. Bathymetric surveys are being scoped for the Teche, Lafourche, and Modern Deltas for the 2015 time frame and USGS and the CPRA are in contracting for bathymetric surveys in the vicinity of the Chandeleur Islands in 2015. Other variables such as habitat mapping and surficial sediment sampling are under negotiation as well and will be conducted during the appropriate time frames for data comparisons. Currently, historic datasets are also being considered for those areas not already covered under the initial BICM effort.

Additional data collections such as subsidence, overwash incidents, and annual shoreline survey profiles are being proposed and budgeted based on user input and needs identified for the 2017 Master Plan update, as well as storm damage assessments and other programs (Figure 14).

3.2 Monitoring of the Emergency Berms

In response to the *Deepwater Horizon* oil spill which began on April 20, 2010, the State of Louisiana constructed approximately 16 miles of sand berms along several sections of the state's barrier islands both east and west of the Mississippi River. The objective of this project was to provide a barrier to oil and minimize the potential impact of the oil spill to thousands of acres of fragile barrier islands and wetlands in coastal Louisiana. These berms are man-made features, were constructed for a specific purpose, as stated above, and are different geomorphologically than native barrier islands. However, significant insight into coastal processes which affect barrier islands can be gained by monitoring their changes over time. On May 27, 2010, a NOD-20 emergency permit (MVN 2010-1066-ETT) was issued by the U.S. Army Corps of Engineers (USACE), New Orleans District (CEMVN). The emergency permit allowed the construction of sand berms in specified areas or "reaches". Specifically, reaches E3 and E4 to the east of the Mississippi River, and reaches W8, W9, W10, and W11 to the west of the Mississippi River, were authorized for a total of approximately 38 miles of barrier berm. These areas were identified by USACE staff as critical locations where greater immediate benefit was likely to be achieved with minimal adverse disruption of the coastal environment. Only reaches E4, W8, W9

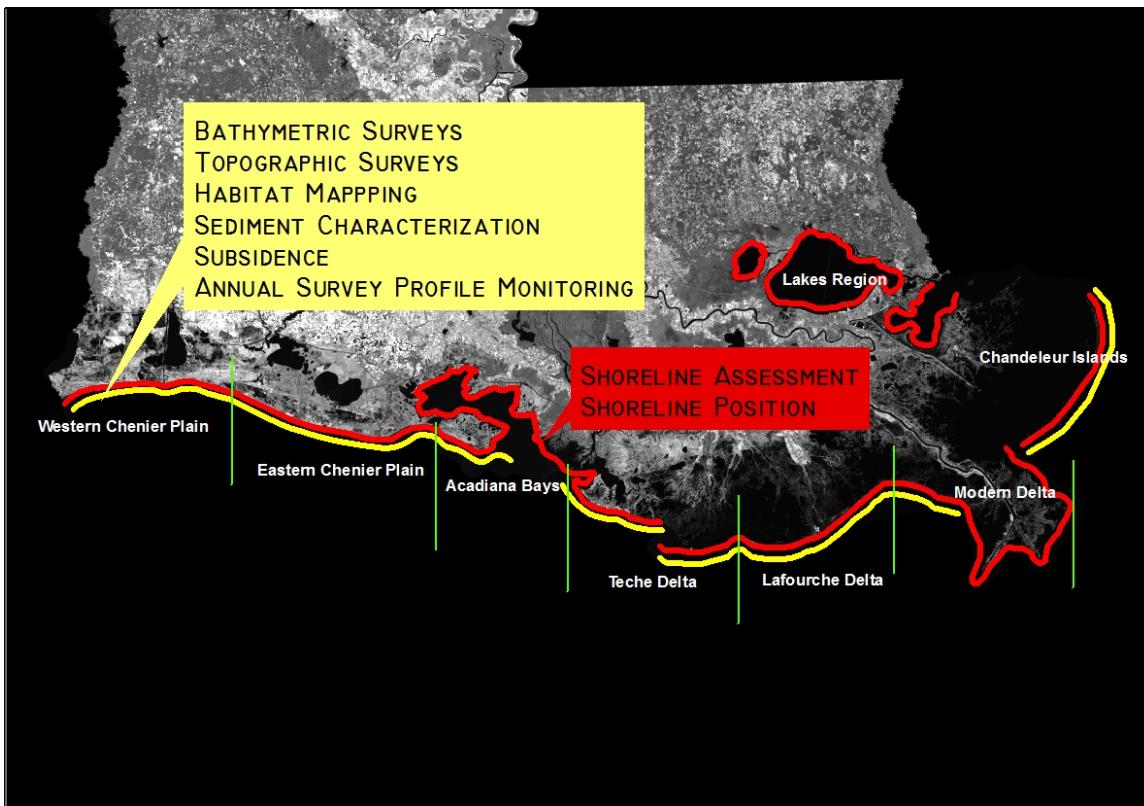

Figure 14. Proposed BICM data collection structure for the 2013 through 2017 work effort. Note the additional areas of effort in the Eastern Chenier Plain and Teche Delta regions.

and W10 (over 83,000 linear feet; approximately 16 miles of sand berm) were constructed under the NOD-20 emergency permit (Figures 15 and 16). Reaches W11 and E3 were not constructed.

Monitoring was required as a part of the emergency permit. Transects were established perpendicular to the shoreline, beginning at a point 1,000 feet landward from the inside toe of the berm and ending at the -20 foot NAVD 88 isobath. The constructed berms were surveyed along these transects at five time-intervals: after construction (as-built), and at 30-, 90-, 180- and 360-days post-construction to estimate sand-volume-changes (Table 1).

The monitoring data suggest that for berm reach E4, 77% of the fill had been retained at the 360-day monitoring survey; for berm reach W8, 83% of the fill had been retained at the 360-day monitoring survey; for berm reach W9, 79% of the total volume placed appears to be retained at 360-days post-construction and for berm reach W10, approximately 91% of the volume placed in the berm had been retained at the 360-day monitoring survey. It should be noted that the direct causes of the changes in sand volumes discussed above are difficult to determine at this time. However, these changes are undoubtedly attributed to a combination of factors, such as longshore transport, overwash, settlement, and subsidence that have all been experienced along Louisiana's barrier island system.

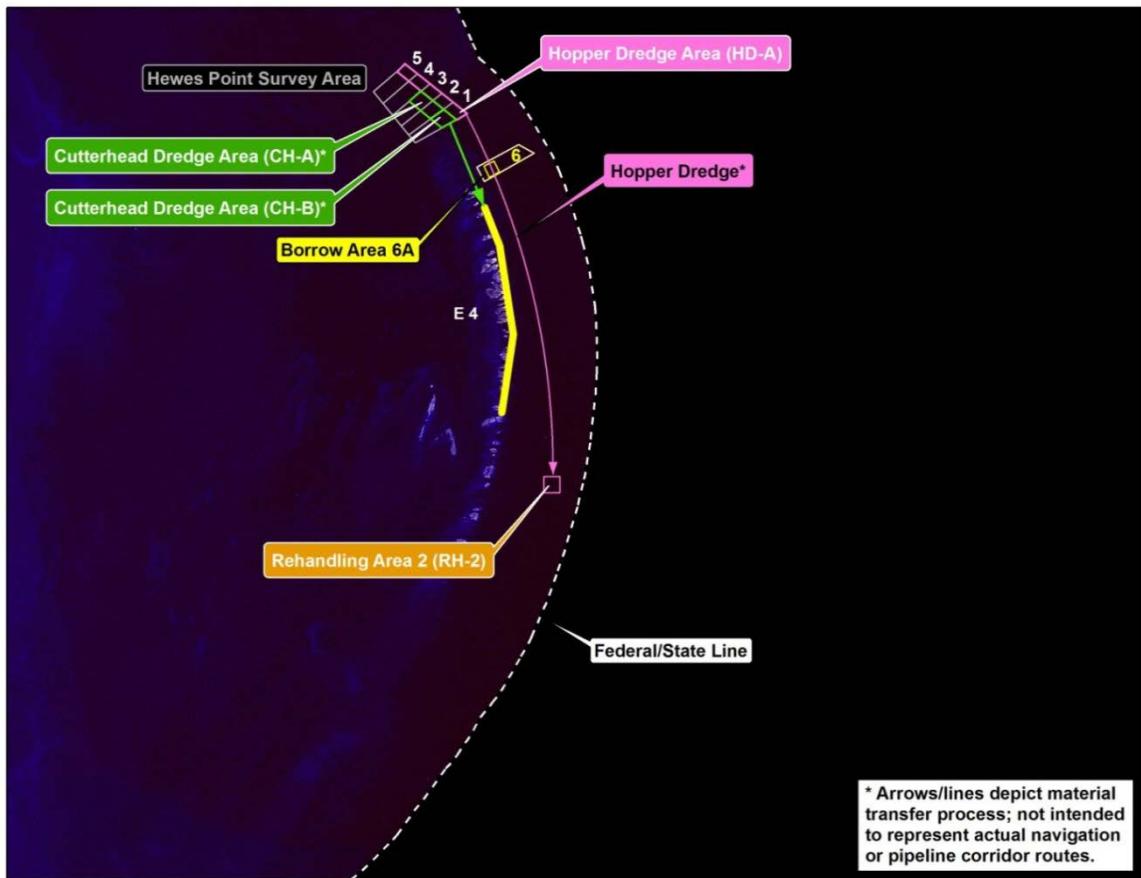

Figure 15. Borrow Area and Sand Berm (E4) locations on the eastern side of the Mississippi River. Sand for E4 was mined from Hewes Point to the north and either placed directly into the berm, or transported to a rehandling area (RH-2) using a hopper dredge (from borrow area HD-A). Borrow Area 6A was used as a temporary borrow site to begin work on the northernmost 2,000 linear feet of Reach E4 of the sand berm and was backfilled with sand from Borrow Area CH-B.

The data collected as part of the monitoring programs are extremely valuable to increase the understanding of coastal processes on Louisiana's barrier islands. Data sets collected at such frequent intervals and relatively tight spacing are rare.

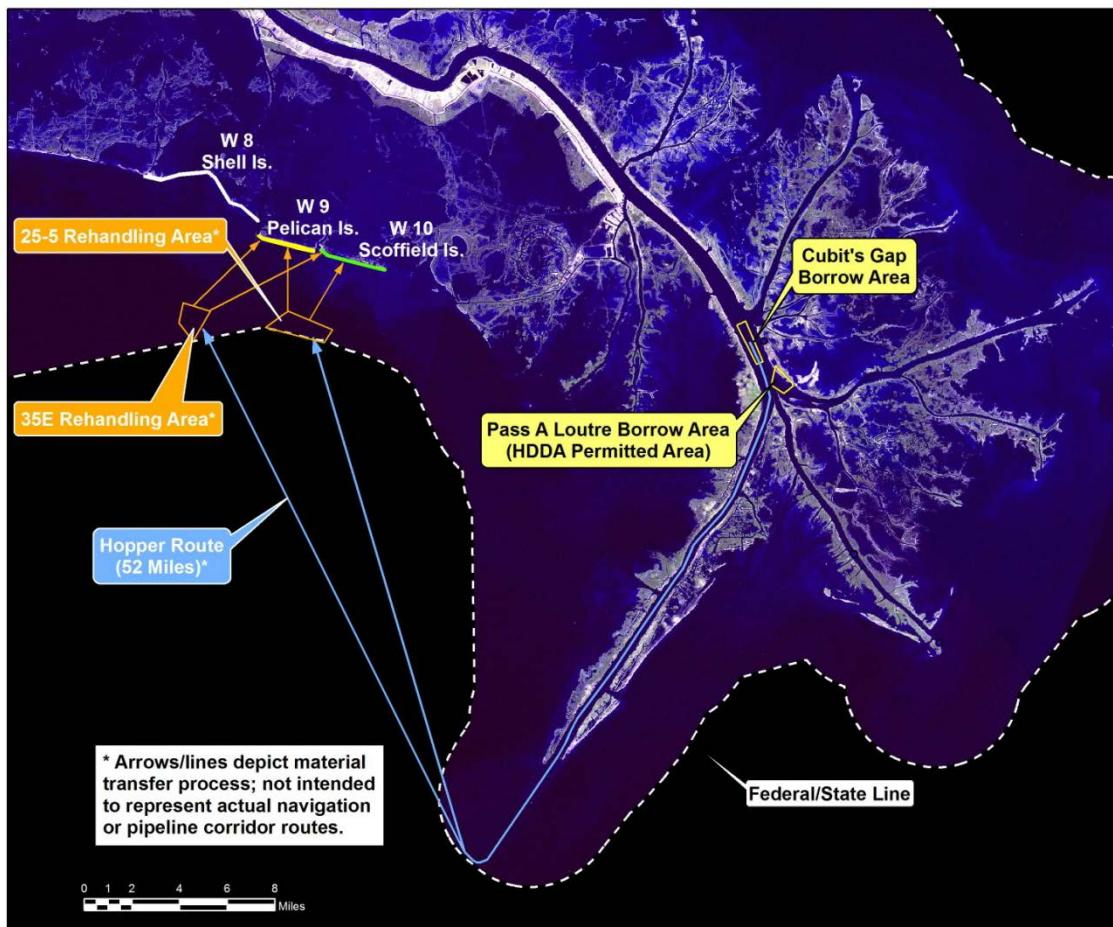

Figure 16. Sand Berm (W8, W9 and W10) and Borrow Area locations on the western side of the Mississippi River. Reaches W8, W9, and W10 were constructed by dredging sand from approved borrow sites in Lower Mississippi River to pre-approved rehandling areas 35E and 25-5.

Table 1. Summary of sand volumes from as-built and monitoring surveys for Emergency Berm reaches.

Reach No.	As-built	Volumes (cy)			
		30-day Monitoring	90-day Monitoring	180-day Monitoring	360-day Monitoring
E4	3,166,600	3,117,400	3,857,400	3,493,000	2,451,700
W8	777,300	722,600	685,100	625,100	642,600
W9	1,242,500	1,194,000	979,800	1,004,300	977,500
W10	964,200	817,100	863,900	931,800	875,200

3.3 Barrier Island Maintenance Program (BIMP)

Several legislative programs have been established on both the state and federal levels that call for the implementation of a program to stabilize and preserve Louisiana's barrier islands and shorelines. House Bill No. 429, Act No. 407, authored by Representative Gordon Dove during the 2004 Regular Session, outlined the process by which the CPRA would annually develop a list of priority projects to be submitted to the House and Senate Committees on Natural Resources. These projects would be funded by the Barrier Island Stabilization and Preservation Fund, which was established by House Bill No. 1034, Act No. 786 of the 2004 Session to provide appropriations, donations, grants and other monies for the program. The legislation requires this fund to be used exclusively by the CPRA to support the Barrier Island Stabilization and Preservation Program, with all interest earnings and unencumbered monies remaining in the fund at the end of the fiscal year.

In accordance with this legislation, and with the understanding that maintenance is an integral part of stabilization, preservation, and restoration of any barrier island or shoreline, BIMP was conceptualized by the CPRA. BIMP provides the framework for categorizing, prioritizing, selecting, and funding state barrier island maintenance projects, while coordinating with CWPPRA and other existing restoration mechanisms.

3.3.1 Rationale

The BIMP program is necessary to quickly coordinate and fund the maintenance of previously constructed barrier shoreline restoration projects in Louisiana. This program can act as a comprehensive management approach to prioritizing rehabilitation efforts in coordination with other restoration initiatives (e.g., CWPPRA, LCA).

During the past decade, numerous barrier islands and headlands in Louisiana have been or are currently being restored by the state and its federal partners through CWPPRA and other sources. CWPPRA projects have a design life of 20 years; however, scheduled maintenance of these projects has not been incorporated into their funding or design. Design of these projects relies heavily on numerical models for predicting their longevity and ultimate success. Inherent in these models are certain assumptions and the realization that there are significant uncertainties about the physical processes that affect the stability of these land masses. If the project is impacted by more events than assumed in the model, the condition of the barrier island or headland deteriorates considerably, thereby reducing the life of the project. The project then requires maintenance to sustain the predicted design template. Maintenance costs can increase exponentially when not performed in a timely manner. Therefore, BIMP is a tool that can be used to formulate a much needed component of maintenance planning for existing projects without maintenance funds. This strategy will address the need for timely and cost-effective maintenance of barrier shoreline projects to ensure their long-term success.

3.3.2 Program Area

BIMP encompasses all barrier islands, headlands, and sandy shorelines, restored or otherwise (Figure 17). Based on the geographic and geologic setting, the domain of the BIMP program includes the eight coastal segments identified below (Campbell et al., 2005).

1. Chandeleur Islands – Northern Chandeleur Islands (Freemason Islands, North Islands, and New Harbor Islands) and Southern Chandeleur Islands (Breton Island, Grand Gosier Island, and Curlew Islands).
2. Plaquemines – Sandy Point, Pelican Island, Shell Island, Chaland Headland (Pass La Mer area), Cheniere Ronquille, and East and West Grand Terre Islands.
3. Lafourche – Grand Isle and Caminada- Moreau Headland.
4. Timbalier Islands – Timbalier and East Timbalier Islands.
5. Isle Dernieres – Raccoon, Whiskey, Trinity, East, and Wine Islands.
6. Freshwater Bayou to Point Au Fer – Point Au Fer, Marsh Island, and Chenier au Tigre.
7. Eastern Chenier Plain – Freshwater Bayou to Calcasieu Pass.
8. Western Chenier Plain – Calcasieu Pass to Sabine Pass.

Grouping these apparently disparate and disjointed units of barrier islands, headlands, and sandy shorelines into coastal segments will facilitate the development of a regional long-term strategy for shoreline maintenance, including project prioritization and development. It should be noted that any alteration to an area within a segment will affect the remainder of the segment due to coastal processes and morphodynamics, and, consequently, the sediment budget.

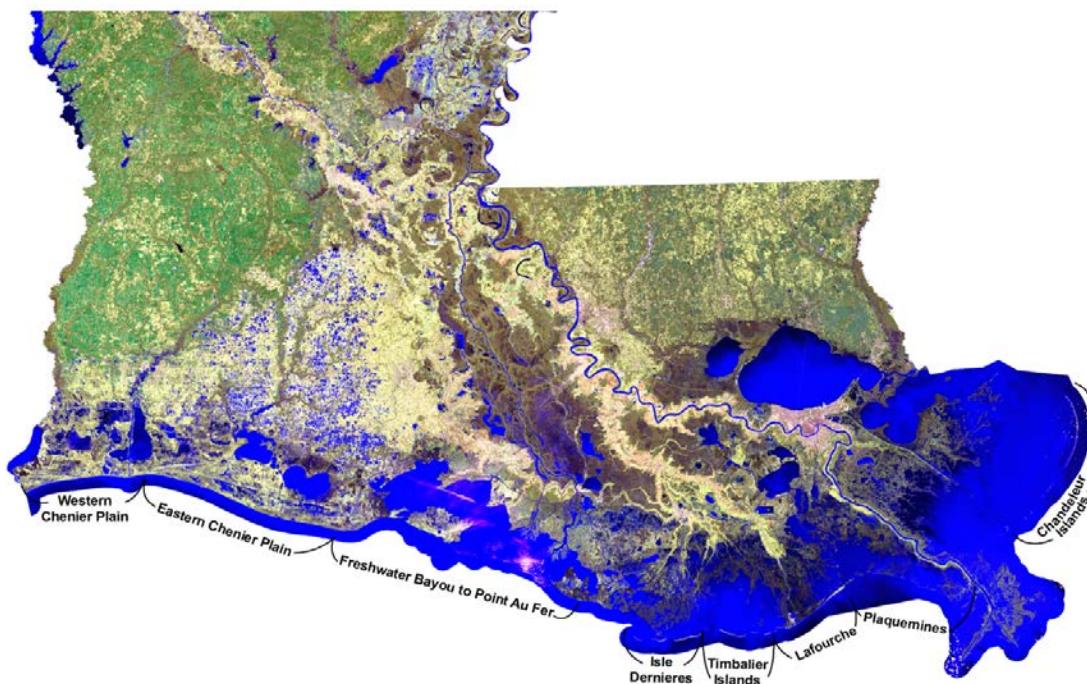

Figure 17. Various coastal segments including sandy shorelines, headlands, and barrier islands.

3.3.3 Funding and Timeline

As part of BIMP, the CPRA will formulate an annual list of potential projects based on inspections of previously constructed projects, post-storm assessments, BICM data, and existing project maintenance schedules. Data from these sources will be used to identify existing projects with an immediate need for repairs. All projects will be compiled and ranked by December 1 of each year. This list, along with recommended funding levels, will be provided to both the House and Senate Committees on Natural Resources for approval and funding. Funding will come from the Barrier Island Stabilization and Preservation Fund as set forth in House Bill No. 1034, Act No. 786 of the 2004 Session.

3.3.4 BIMP Projects

1. The 2006-2007 BIMP projects approved for implementation were the Bay Champagne Marsh Creation and Bay Champagne Sand Fencing projects. Bay Champagne is a 250-acre body of water just east of Port Fourchon in Lafourche Parish. Currently, only a narrow dune feature separates the bay from the Gulf, and a breach of this dune would expose interior marsh to increased erosion. These restoration projects would create 70 acres of marsh in the bay, as well as utilize sand fencing to stabilize the fore and back dune areas. The total combined cost of the projects was estimated at \$2,820,000. These projects were discontinued due to a lack of sediment sources in close proximity. Additionally, the Caminada Headland project currently funded for construction should address the Bay Champagne area of need when it is constructed.
2. The 2007-2008 BIMP selections were the Sediment Bypassing at the Mermenau Jetties and the East Grand Terre Vegetative Plantings projects. The former project planned to add \$1,387,688 in Cameron Parish CIAP funds with \$2,750,000 in BIMP funds to hydraulically dredge sediment adjacent to the east Mermenau Jetty and move it to the west side. This would allow the littoral drift to disperse the sediment on the beach front. The goal of this project was to rebuild approximately 75-100 acres of gulf shoreline at Hackberry Beach. However, this project was deemed unfeasible because a preliminary investigation found there was insufficient sand to justify this project, and preliminary modeling showed that removing sediment adjacent to the east jetty could cause accelerated erosion and possible breaching of the shoreline at the north end of the jetty. The East Grand Terre Vegetative Plantings project will be implemented in the project area of the East Grand Terre Island Restoration (BA-30) CIAP project that was constructed in 2010. The total cost of the BIMP planting project is approximately \$750,000.
3. The BIMP project approved for implementation in the 2008-2009 cycle was the 2009 Sand Fencing Project, which consisted of installation of 34,000 linear feet of sand fencing within the project areas of five constructed barrier island restoration projects in Terrebonne and Plaquemines Parishes. The construction contract amount was \$198,200. The proposed sand fencing was installed on Trinity/East Islands in the eastern Isles Dernieres (TE-20 East Island, TE-24 Trinity Island, and TE-37 New Cut project areas); Timbalier Island (TE-40 Timbalier Island project area); and near Chaland Pass (BA-38 Chaland Headland project area). Installation of the sand fencing will facilitate the capturing of wind-blown sand and building of additional sand dunes on the islands. The work was completed in May 2010. No additional projects were selected this cycle, as the Sediment Bypassing at the Mermenau

- Jetties and East Grand Terre Vegetative Plantings projects were expected to use funds from this funding cycle.
4. There were no new BIMP projects selected in the 2009-2010 cycle, because the Mermertau Jetties project's preliminary feasibility investigations continued through early 2010, and it was expected that the Jetties project would use funding from this cycle. When this project was deemed infeasible, it was hoped that another suitable project could be developed within Cameron Parish, so the funds from this BIMP funding cycle were set aside for this potential new project. However, another suitable project was not identified for this funding cycle in Cameron Parish.

3.4 Breach Management Program

A Breach Management Program is in development to identify, classify, and prioritize methodologies and recommendations for breach prevention (proactive) and response (reactive) measures. A detailed analysis of coastal restoration projects completed in 2014 quantified the effects of breaching on barrier islands and headland beaches, specifically computing the significant increases in shoreline erosion rates. The Breach Management Program has developed a methodology to classify breach potential along the Louisiana coastline between Raccoon Island to the west and Scofield Island to the east. Barrier islands classified as having the potential to breach within four years are classified as severe and breach prevention measures are being developed for those areas. Opportunities are being explored to strategically partner breach prevention measures with other barrier island projects scheduled in the near-term within the Coastal Master Plan or as Beneficial Use Projects for disposal of maintenance dredged sediments from federal navigation channels.

3.5 Borrow Area Monitoring and Maintenance (BAMM)

To ensure the efficient and effective use of limited sediment resources in Louisiana, a Borrow Area Monitoring and Maintenance (BAMM) project was initiated and funded through CIAP as a part of the Performance Evaluation and Science Monitoring Project. The BAMM project provides information to understand the evolution of the borrow pits (inland, riverine, and offshore) over time, especially the infilling characteristics (rate and types of sediment) and gradient and depth (depending upon hypoxic condition development) of the pit-slopes. Also a numerical modeling effort was undertaken to analyze and evaluate potential adverse impacts to wave climate and hydrodynamics if large inland borrow areas are dredged to mine about 50 MCY of sediment.

The goals of BAMM are to develop general guidelines for developing criteria for location, delineation, and design of potential borrow areas in inland, riverine and offshore environments for coastal restoration projects in Louisiana in a cost effective manner which will have minimal adverse impact on the adjoining coastal system. This included review of potential dredge impacts, existing wave analysis work and other related studies. Geophysical, geotechnical and water quality data were collected from several borrow areas. The combined information gathered during these efforts was analyzed and used to provide recommendations on borrow area location, depth of dredging, and design.

Additionally many of the current marsh creation and restoration projects in Louisiana specify that fill material be obtained from borrow areas designed within interior lakes and bays. The use of “inland” borrow areas is governed by numerous restrictions and/or regulations. Most of these regulations focus on vertical and horizontal dredging limits. The impacts of these aspects of borrow area design on wave heights and energies as well as on the surrounding marsh environment are not clearly understood. Therefore, the scientific basis of these restrictions and/or regulations needs to be investigated to determine whether these borrow area design constraints are justified.

The BAMM project is divided into four tasks and a cumulative final report. As of November 2014, the second draft Project Inventory and Literature Search (Task 1) has been submitted along with Draft Final Report. Task 2, the Bathymetric and Geophysical Collection and Analysis, was completed in May of 2013. The maps created from this data collection were analyzed/processed to assist in the calculation of infilling rates of the borrow areas and general bathymetric changes in elevation. The Hypoxia Monitoring (Task 3) involved the deployment of gauges that measure dissolved oxygen, salinity and temperature in six borrow area locations. One gauge was placed within each chosen borrow area and another was placed approximately 0.5 miles outside of the borrow area and acted as a control. The gauges were deployed for four consecutive months (June-October) with data collection occurring once a month. The gauges were collected for a final time in the last week of October 2013. Task 4’s calibration report on Model Development was authored in October 2013. The Task 4 interim report was submitted and reviewed. The final report, currently being reviewed, includes recommendations on borrow area location, depth of dredging and design developed through analysis of the four subsequent tasks.

3.6 The Caminada – Moreau Subsidence Study (CMSS)

Marsh and barrier island restoration rely on placement of large quantities of sediment on existing substrate that is often highly compressible. Engineering design of restoration projects requires knowledge of background subsidence rates, the relationship between surface loading and subsurface compaction, and settlement of the fill after placement. The Caminada – Moreau Subsidence Study (CMSS) was conceptualized, planned, developed and undertaken to evaluate the existing geological profile of deltaic deposits at foreshore, dune, and backshore locations along the Caminada Moreau; evaluate subsidence in these areas; and monitor subsidence before (for baseline measurement) and after loading sediment for the restoration of Caminada Headland. This is a first-of-its-kind study as no direct measurement of subsidence and its partitioning has been previously attempted. Several challenges arose during the study, requiring changes to the scope and approach.

This study was funded by CIAP and formed a part of the Performance Evaluation and Science Monitoring Project. The study was conducted under three sequential major phases (Phase 1, 2, and 3) which included the evaluation of the existing geological profile, an evaluation of subsidence, and the installation of 10 subsurface monuments at three different stations. Anchors were placed at various depths in three locations along the Caminada headland to monitor variability in compactional subsidence associated with loading from the fill, including settlement plates. In addition, a primary benchmark was established outside the influence of the fill to record background subsidence for this region. These monuments are being monitored via 10

different surveys spread over next two years during Phase 4 to document subsidence trends throughout the period. High-accuracy leveling surveys were conducted for each anchor location relative to the control benchmark to an accuracy of ± 0.03 feet. Preliminary results for the first 14 months of surveys document subsidence at all depths in the sediment column for sites where fill placement is complete. Although the first anchor below the surface recorded the greatest amount of subsidence (0.25 to 0.3 feet at about 20 feet deep), anchors at 60 to 80 feet deep recorded 0.09 feet of compactional subsidence as well. This quantity of settlement at depth is more than expected, and requires further evaluation of deeper sediment layers to identify the depth at which compactional subsidence due to loading from beach restoration is within measurement uncertainty. Background subsidence calculations from control benchmark measurements indicate a subsidence rate of about 0.03 ft/yr (9.2 mm/yr), very consistent with National Geodetic Survey relative sea level rise measurements at Grand Isle of 9.1 mm/yr. The final survey is scheduled to be completed by mid-July 2015 and the final deliverable will be submitted by 31 August 2015.

Further the final data in the spreadsheets will be invaluable for calibrating/validating compactional subsidence model (developed by Dr. Julie Rosati, ERDC) for use with future beach restoration projects along the barrier island shorelines of south Louisiana.

A copy of the report entitled “Caminada-Moreau Subsidence Study (Phases 1-3)” can be found in the CPRA Document Database at the following link:

<http://sonris-www.dnr.state.la.us/dnrservices/redirectUrl.jsp?dID=4715311>

4.0 Barrier Island Performance Assessment

4.1 Overall Barrier Shoreline Condition

Louisiana’s barrier shoreline is one of the fastest eroding shorelines in the world. Due to the geologic setting and the predicted changes in sea level during coming decades, these shoreline habitats and the services they provide are some of the most vulnerable features of our coastal landscape. The CPRA’s BICM Program has been established to assess and report on the changes of the coastal shoreline to help develop programmatic approaches to restoration and maintenance. In addition, the CPRA funded an interim study (CEC, 2012) to look at barrier island performance in the five years since BICM data were collected.

Current shoreline erosion data from BICM (Martinez et al., 2009) indicate that most of Louisiana’s shoreline is eroding faster than ever before, with some short-term (1996 – 2005) erosion rates more than double the historic (1890s – 2005) averages (Figures 18 and 19). However, recent information from the post-BICM studies elucidate the benefits of recent restoration projects. This section presents the overall findings from BICM and then a more detailed discussion by geomorphologic delta complex follows.

The Chandeleur Islands have exhibited the largest changes in erosion rates. Historic erosion rates of approximately 27 ft/yr have increased within the past decade to over 125 ft/yr, predominantly due to storm activities. This has led to a decrease in the overall size of Breton Island by approximately 776 acres, or 95 percent (Table 2). Additionally, over 66 percent (85.1 acres) of the land area remaining in 2004 was removed by Hurricanes Katrina and Rita in 2005. When compared to the fact that only 18 percent (150.7 acres) of the land mass was lost between

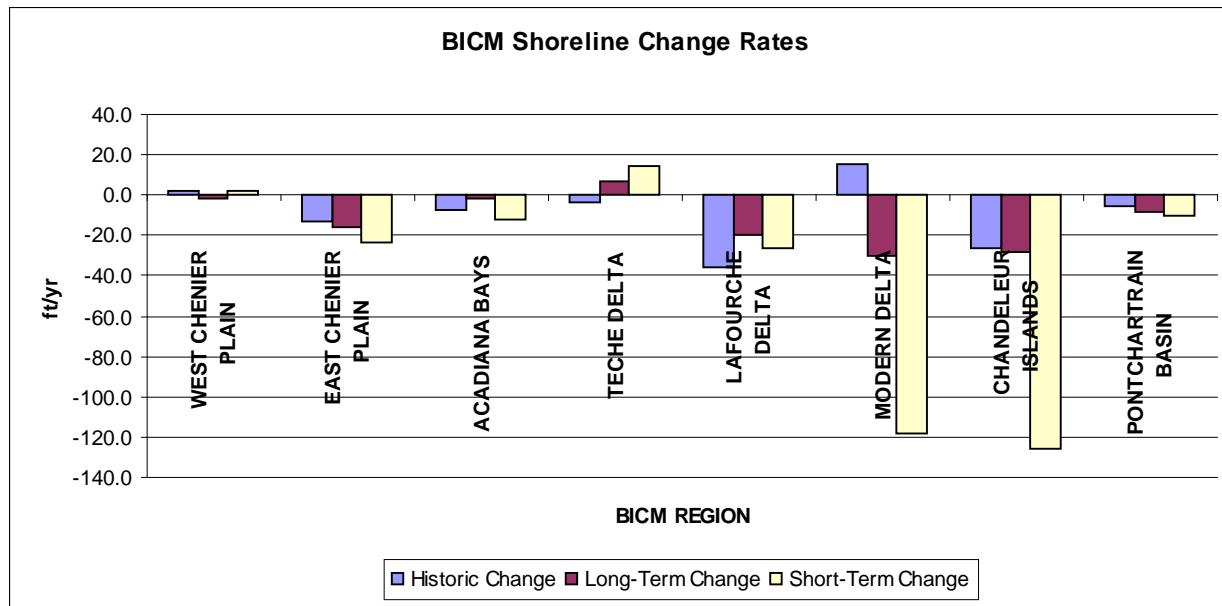

Figure 18. Average shoreline erosion rates for BICM Regions of the Louisiana Coast developed from aerial photography for Historic (1890s – 2005), Long-term (1930s – 2005), and Short-term (1996 – 2005) periods.

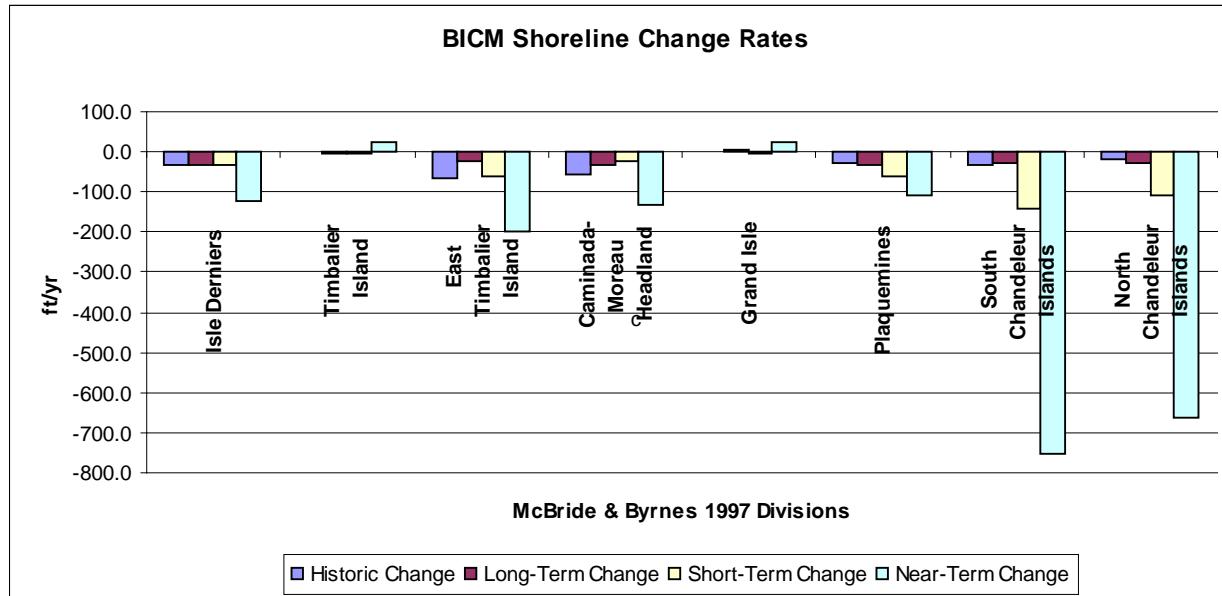

Figure 19. Average shoreline erosion rates for various sections of the Louisiana coast including the direct impacts of Hurricanes Katrina and Rita (Near-Term 2004 – 2005). Note that the Timbalier Island shoreline accreted due to the 2004/05 CWPPRA restoration project (TE-40) (McBride and Byrnes 1997).

Island	1800s	1922-30s	1996-98	2004	2005	Projected Year of Disappearance
<i>Breton</i>	820.4	669.7	212.3	128.7	43.6	2013
<i>Chandeleur</i>	6,827.50	6,140.60	4,333.10	2,789.60	913.9	2026
<i>Grand Gossier/Curlew</i>	1,119.40	71.7	595.5	75.2	0

<i>Shell Island</i>	313.8	432.4	89.7	56.5	51	2029

Table 2. Historical (1800s-2005), long term (1930s-2005), and short term (1996-2005) barrier island changes in acres and the projected date of disappearance (Martinez et al., 2009).

1850 and 1920, this emphasizes the need to maintain the islands so that they are more sustainable during storm events. The data seem to indicate that there is a “tipping point” when an island breaches, beyond which erosion accelerates, restoration costs increase exponentially, and results may become less predictable.

The large reduction of Breton Island within the last decade, along with the extreme loss experienced from Hurricane Katrina, emphasizes the need to maintain flexibility in setting restoration priorities. McBride and Byrnes (1997) predicted that Breton Island would disappear in 2106 based on the land loss rates through the 1980s. When compared to other islands that were projected to be lost in the early 2000s, the restoration of Breton Island was a comparatively low priority. However, based on BICM data collected after Hurricanes Katrina and Rita, the projected disappearance for Breton Island based on the land loss rates through 2005 (does not include impacts from Hurricanes Gustav and Ike in 2008 or Hurricane Isaac in 2012) is now 2013 (Table 2). More dramatic than Breton Island are Grand Gossier and Curlew Islands which were predicted by McBride and Byrnes (1997) to last until 2174, yet these islands were both reduced to shoals by Hurricane Katrina in 2005.

The good news is that restoration efforts on other islands have shown benefits. McBride and Byrnes (1997) predicted Timbalier Island would disappear by 2046, based on data through the 1980s. However, restoration completed just prior to Hurricanes Katrina and Rita added approximately 10 years of life to the island. Also, McBride and Byrnes (1997) predicted that the Isles Dernieres would disappear by 2017; however, the CWPPRA barrier island restoration projects constructed on the islands have increased their life span by approximately 16 years. However, additional storms, increasing erosion rates, and predicted sea-level rise still need to be taken into account for designing future projects.

The *Deepwater Horizon* oil spill presented an entirely new challenge to coastal Louisiana. The state responded with a robust effort to safeguard its coast from the effects of the oil. In June 2010, the state began construction of barrier berms along the Chandeleur Islands east of the Mississippi River (East Barrier Berm) and from Shell Island to Scofield Island west of the river (West Barrier Berms). The construction of the Barrier Berm projects introduced a significant amount of sand into the state's barrier island systems. To maximize this opportunity, the state utilized the berm sand and approximately \$100 million of the funds set aside for berm construction to convert the temporary berm features into the more resilient barrier island features that were designed as CWPPRA projects. Construction of the CWPPRA Scofield project (BA-40) and Shell Island East (BA-110) was funded by these Berm to Barrier funds.

Additional datasets and analysis, ongoing under BICM, are also beginning to show information which will hopefully increase our ability to forecast priority areas and better predict project outcome. Until final reports are concluded for all sections of the coast, the main indications are that:

1. Coastal shoreline erosion rates are increasing (Figures 18 and 19). Along the central coast barriers, interior wetland loss results in increasing tidal prism (volume of water that flows through the inlet during each tidal cycle) (Figure 20). Central coast sand is sequestered in expanding ebb tidal deltas as inlets widen and deepen and these processes occur at the expense of barrier island sand volume. This sequestering of sand volume offshore has dominated over relative sea level rise in reducing island area.
2. Hurricane impacts and subsequent recovery processes dominate Chandeleur Islands evolution, whereby sand is removed from the central portion of the island and distributed laterally, ultimately coming to rest in deepwater sinks at the flanks of the barrier island arc (Figure 21). This better understanding of the sediment transport pathways and scales allows efficient barrier island management strategies to be developed.
3. Seafloor change analysis results show that long-term sediment transport trends are about two orders of magnitude greater than calculated predictions of longshore sediment transport potential in the nearshore zone based on historical wave data (millions of cubic meters per year instead of tens of thousands) (Figure 22).
4. The identification and quantification of these sediment transport processes, pathways, and sinks is crucial for successful sediment budget management and sediment allocation and project prioritization.

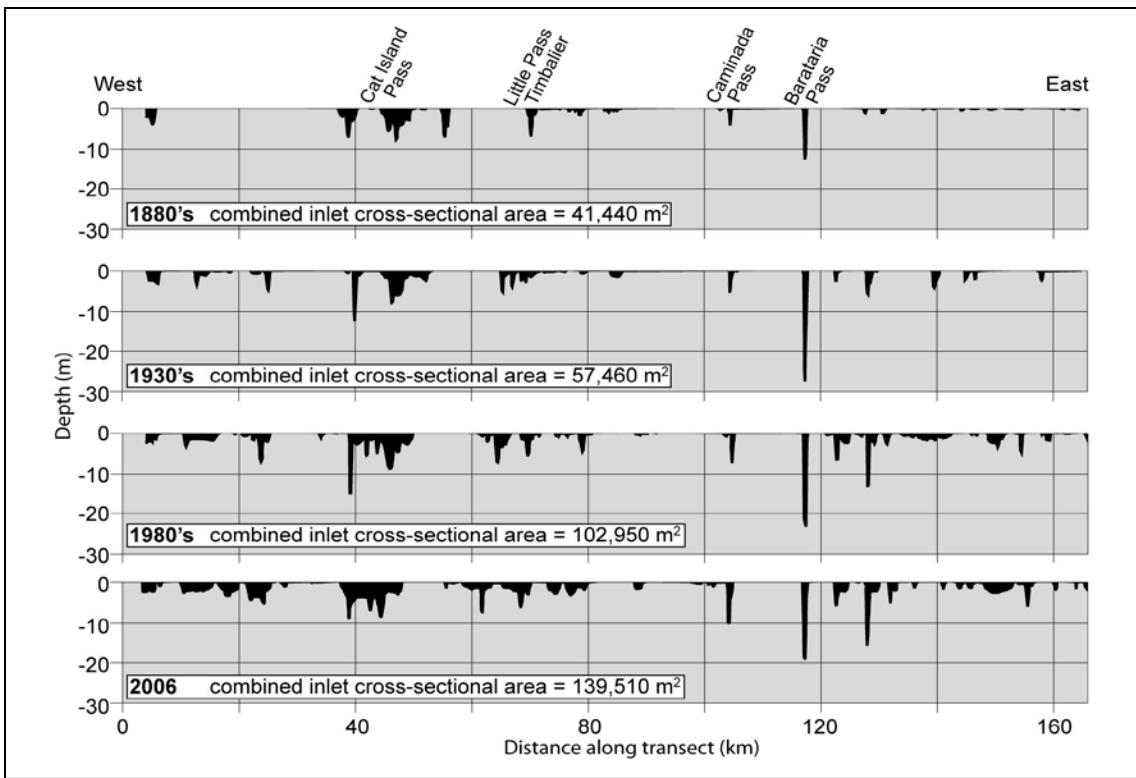

Figure 20. Combined tidal inlet cross-sectional area for Raccoon Point to Sandy Point for each time period covered by the study (1880–2006). Profiles trend along the barrier shoreline and intersect inlets at the location of minimum throat cross-sectional area for each time period. Note the widening and deepening at existing inlets as additional, stable inlets simultaneously form, resulting in a more than threefold increase in combined cross-sectional area during the past 125 years in response to an increasing tidal prism associated with interior marshland loss. The 1880s to 1980s bathymetry is from List et al. (1994) (from Miner et al., 2009).

4.2 Teche Delta Barrier Islands (Raccoon Island to Wine Island)

The Teche Delta Barrier Islands (Isles Dernieres) benefitted from the first barrier island restoration projects funded through the CWPPRA program (Figure 23 and Table 3). In total, six projects have been constructed in this region.

According to the BICM data presented above through 2005, the Teche Delta barrier islands were projected to disappear by 2033. A more recent study including post-BICM data reports disappearance date by island and suggests that restoration projects may have extended the life expectancy of these islands.

4.2.1 *Raccoon Island*

The land area over time for Raccoon Island is plotted in Figure 24. It is noted that Raccoon Island underwent emergency restoration in 1994 which may have contributed to the upward trend between 1990 and 1998. Although no sediment was placed on the island, it has benefitted

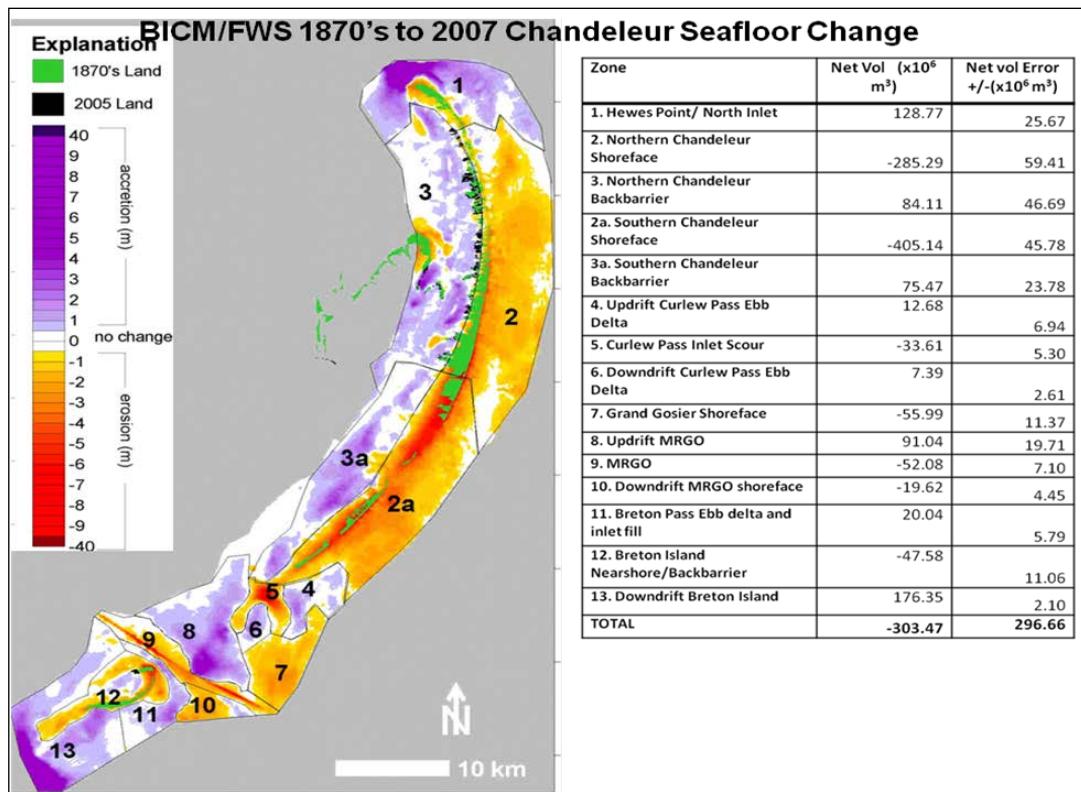

Figure 21. 1870s to 2006-07 seafloor change from Breton Island to Hewes Point. Note the large magnitude of erosion on the center shoreface as well as the large deposition zones at each terminal end of the arc. (UNO/PIES)

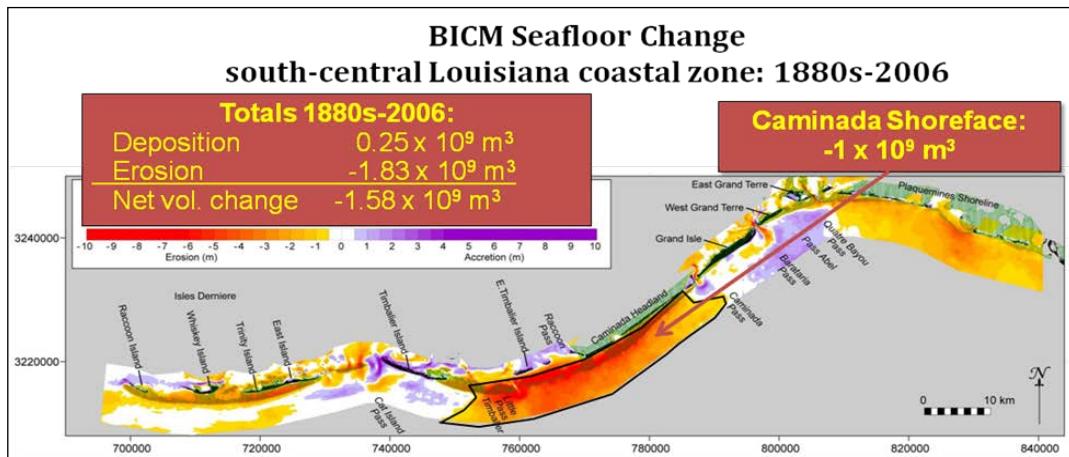

Figure 22. 1880s to 2006 seafloor change from Raccoon Point to Sandy Point. Note the large magnitude of erosion fronting the Caminada Headland and the Plaquemines barrier shoreline, as well as the deposition at ebb-tidal deltas in the coastal bights at Cat Island Pass and the Barataria Inlets. The map coordinate system is UTM Zone 15 N meters. The 1880s bathymetry is from List et al. (1994). Shoreline data are from Martinez et al. (2009). (Miner et al., 2009).

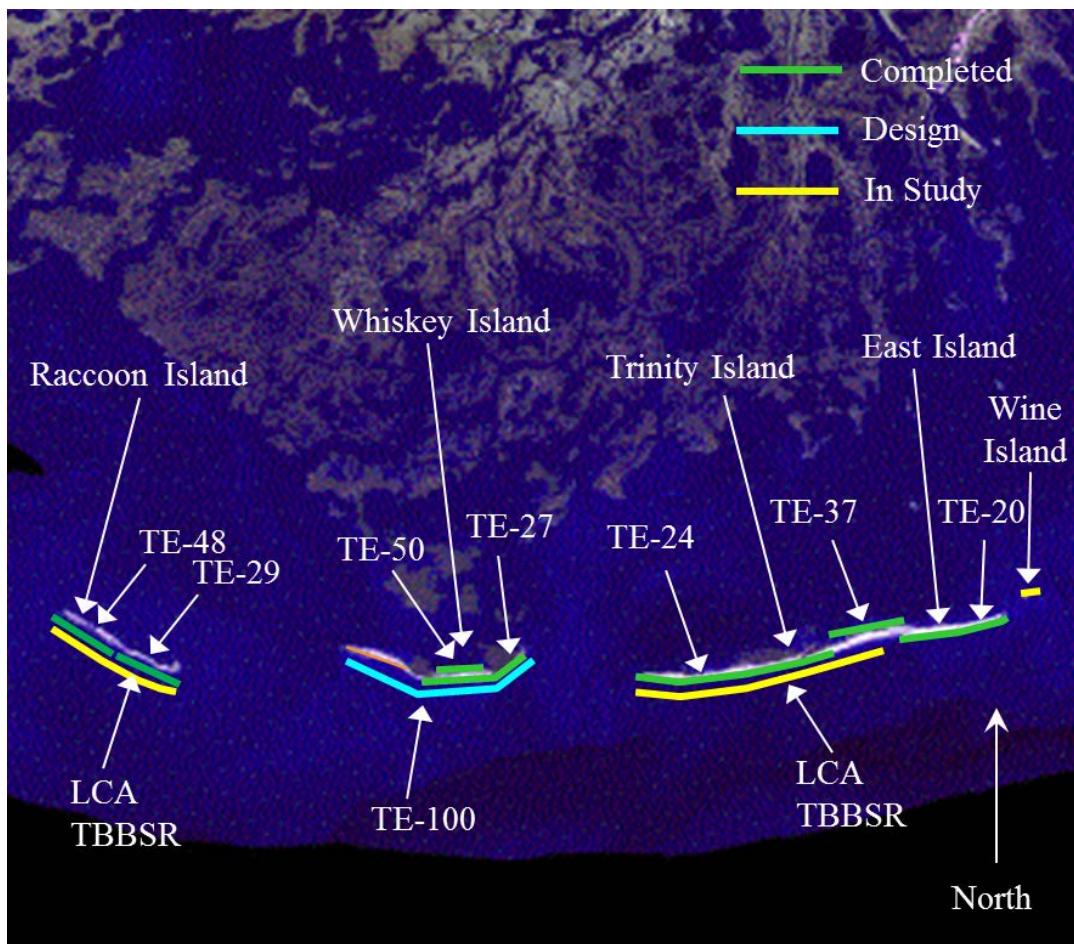

Figure 23. Location of barrier island restoration projects in Teche Delta Barrier System. (CEC, 2012).

Table 3. List of projects constructed, funded for construction, and for future implementation in the Teche Delta Barrier System.

Barrier Shoreline Restoration Projects	Funding Program	Construction Date
Teche Barrier System		
<i>Constructed Projects</i>		
Raccoon Island Breakwaters (TE-29)	CWPPRA	1997
Whiskey Island Restoration (TE-27)	CWPPRA	1999
Whiskey Island Back Barrier Marsh Creation (TE-50)	CWPPRA	2009
Isles Dernieres Restoration Trinity Island (TE-24)	CWPPRA	1999
New Cut Dune and Marsh Restoration (TE-37)	CWPPRA	2007
Isles Dernieres Restoration East Island (TE-20)	CWPPRA	1999
Raccoon Island Shoreline Protection/ Marsh Creation (TE-48)	CWPPRA	2007, 2013
<i>Funded for Construction</i>		
NRDA Caillou Lake Headlands (TE-100) (in design) (includes Ship Shoal: Whiskey West Flank Restoration (TE-47))	NRDA	TBD
<i>Future Projects</i>		
None		

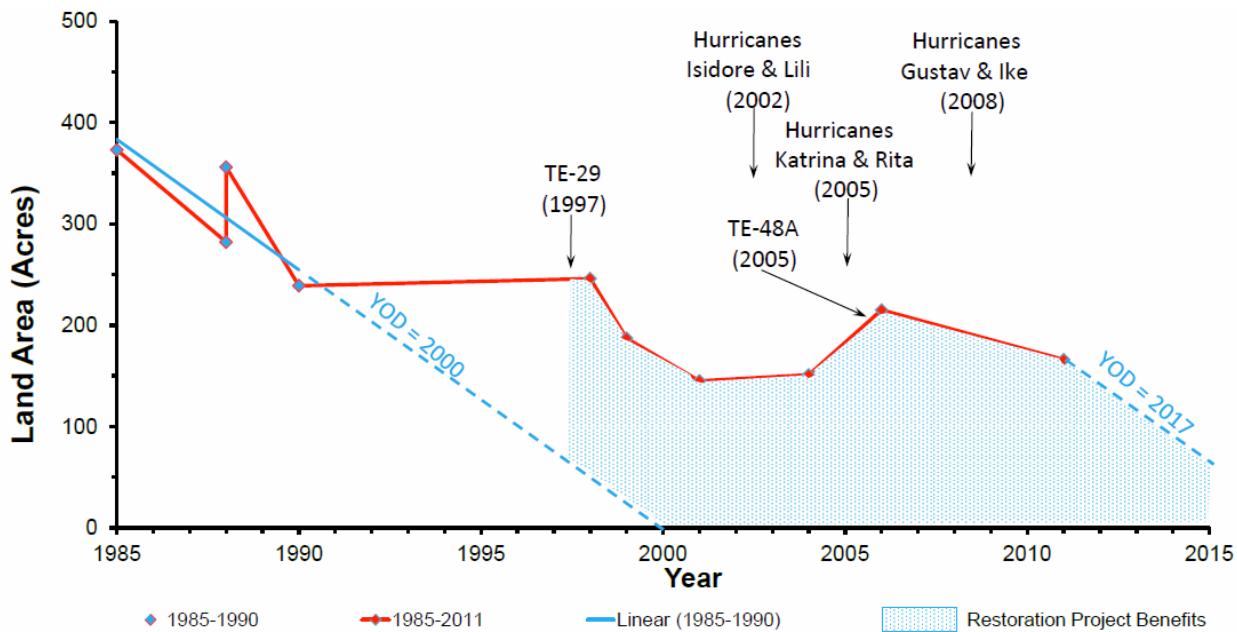

Figure 24. Raccoon Island Land Area Change Analysis (CEC, 2012).

from two CWPPRA projects, TE-29 and TE-48A, which included installing breakwaters, first in 1997 and again in 2007. These breakwaters re-oriented the wave climate/energy regime in such a way that sand from an adjacent, nearshore shoal was redistributed as inverted salients between the breakwaters and the island. The pre-breakwater Year of Disappearance (YOD) was projected to be 2000. Hurricanes Katrina and Rita caused significant land loss on Raccoon Island in 2005 (Martinez et al., 2006); however, post-breakwater installation, the YOD was projected to be 2017. The benefits of barrier shoreline restoration are evidenced by the post-breakwater increase in island longevity, projected to be 17 years, compared to the pre-breakwater projected rate of disappearance.

4.2.2 Whiskey Island

The land area over time for Whiskey Island is plotted in Figure 25. The island benefitted from two CWPPRA restoration projects, the first, TE-27, in 1999 and the second, TE-50, in 2009. The pre-restoration YOD was projected to be 2091. Post-restoration, the YOD was projected to be 2130. It is noted that Hurricanes Katrina and Rita caused significant land loss on Whiskey Island in 2005 (Martinez et al., 2006), reducing its acreage below the trend line. The benefits of barrier shoreline restoration are evidenced by the post-restoration increase in island longevity, projected to be 39 years, compared to the pre-restoration projected rate of disappearance.

4.2.3 Trinity-East Island

The land area over time for Trinity-East Island is plotted in Figure 26. It is noted that East Island was the site of a pilot study project in 1985, and received a breach repair project in 1996 which

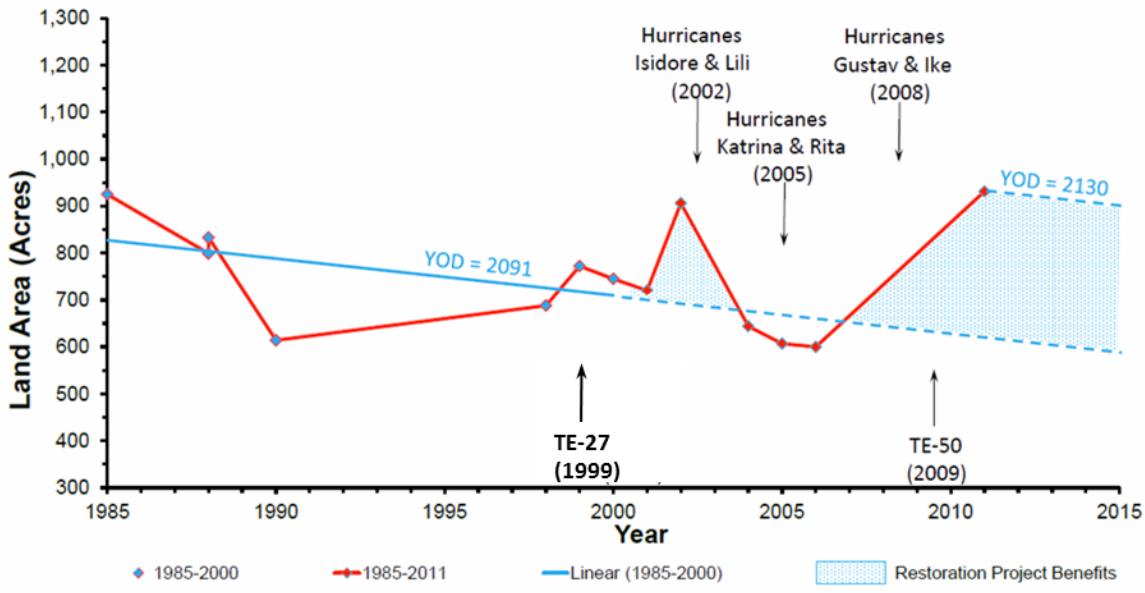

Figure 25. Whiskey Island Land Area Change Analysis (CEC, 2012).

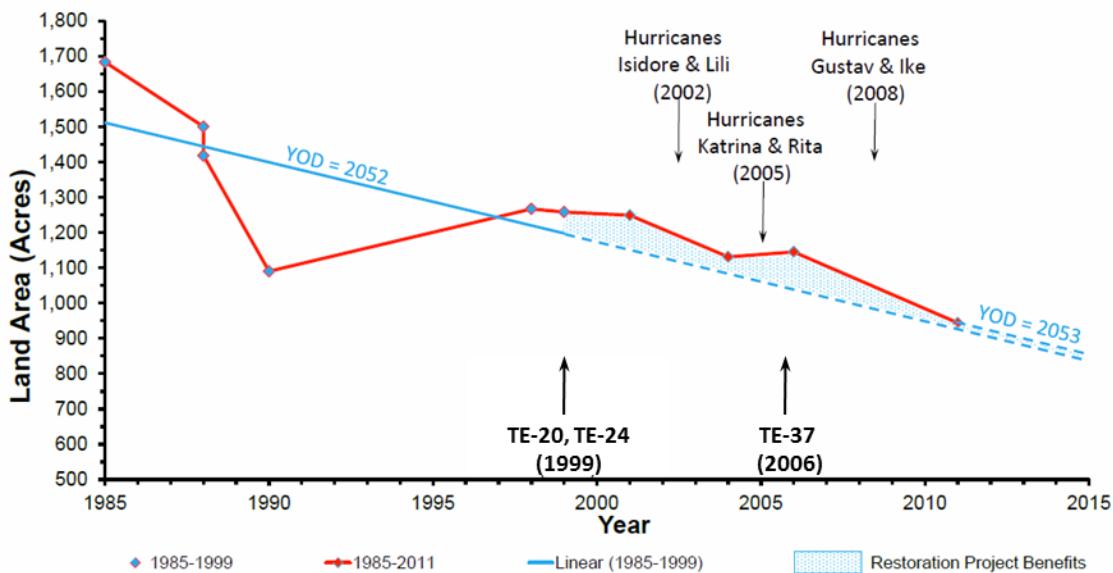

Figure 26. Trinity-East Island Land Area Change Analysis (CEC, 2012)

may have contributed to the upward trend between 1990 and 1998. The islands benefitted from the CWPPRA restoration projects, TE-20 and TE-24 in 1999, and TE-37 in 2007. The pre-restoration YOD was projected to be 2052. Post-restoration, the YOD was projected to be 2053. It is noted that Hurricanes Katrina, Rita, Gustav, and Ike caused significant land loss on Trinity-East Island between 2005 and 2008 (Doran et al., 2009; Martinez et al., 2006). As such, it is expected that the land loss rate would have accelerated, and in absence of the 1999 restoration project, Trinity-East Island would have disappeared significantly sooner than the 2052 projection.

4.3 Lafourche Delta Barrier Islands (Timbalier Island to Grand Isle)

The Lafourche Delta Barrier Islands have benefitted from a number of barrier island restoration projects, most recently the East Grand Terre Island Restoration project (BA-30) that was completed through CIAP (Figure 27 and Table 4). In total, five projects have been constructed in this region and several others are planned.

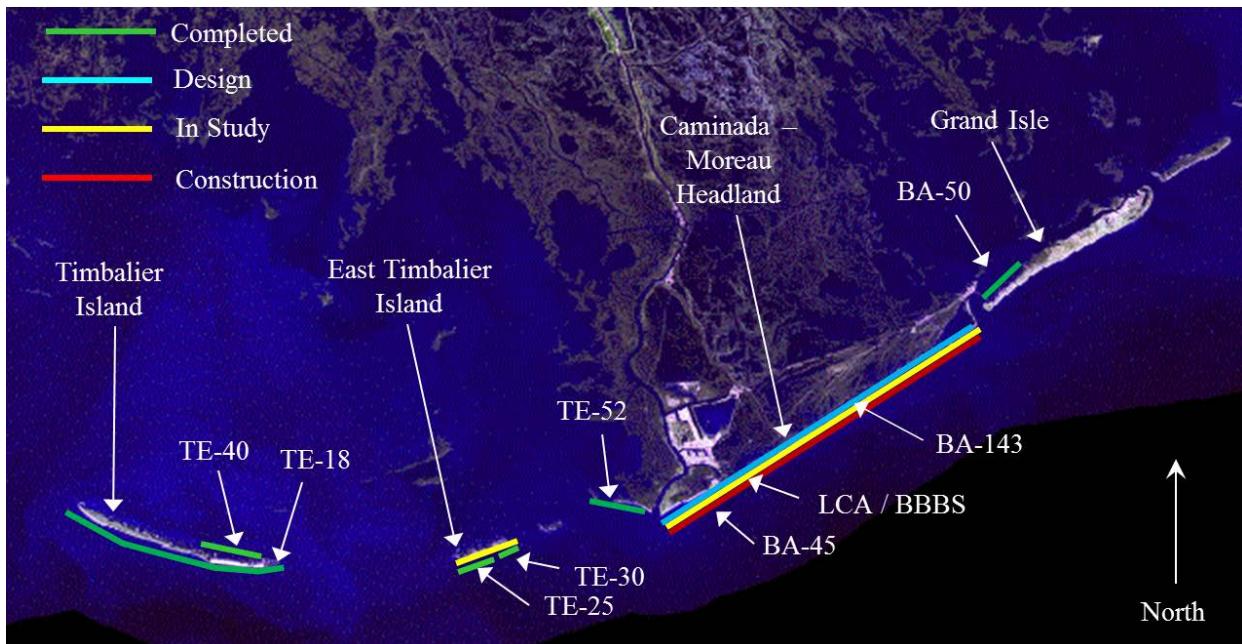

Figure 27. Location of barrier island restoration projects in Lafourche Delta Barrier System (CEC, 2012).

According to the BICM data through 2005, the projected years of disappearance for these islands are 2056 (Timbalier), 2138 (East Timbalier), 2867 (Grand Isle), and 2044 (Grand Terre). A more recent study including post-BICM data reports disappearance date by island and suggests much sooner rates of disappearance for Timbalier (2044) and East Timbalier (2018) islands.

4.3.1 Timbalier Island

The land area over time for Timbalier Island is plotted in Figure 28. It is noted that Timbalier Island was the site of a breach repair project in 1996, which may have contributed to the upward trend in land area between 1990 and 1998. The island was restored through CWPPRA project TE-40 in 2004. The pre-restoration YOD was projected to be 2043. Post-restoration, the YOD was projected to be 2044. It is noted that Hurricanes Katrina, Rita, Gustav, and Ike caused significant land loss on Timbalier Island between 2005 and 2008 (Rodrigue et al., 2011; Martinez et al., 2006). As such, it is expected that the land loss rate would have accelerated, and in absence of the 2004 restoration project, Timbalier Island would have disappeared significantly sooner than the 2043 projection.

Table 4. List of projects constructed, funded for construction, and for future implementation in the Lafourche Delta Barrier System.

Barrier Shoreline Restoration Projects	Funding Program	Construction Date
Lafourche Barrier System		
<i>Constructed Projects</i>		
Timbalier Island Planting Demonstration (TE-18)	CWPPRA	1996
Timbalier Island Dune and Marsh Creation (TE-40)	CWPPRA	2004
East Timbalier Island Sediment Restoration, Phase 1 (TE-25)	CWPPRA	2000
East Timbalier Island Sediment Restoration, Phase 2 (TE-30)	CWPPRA	2000

Barataria Basin Barrier Shoreline (BBBS) Restoration (BA-10)	LCA	TBD
Eastern portion of Caminada		
East Timbalier Island	NFWF	TBD

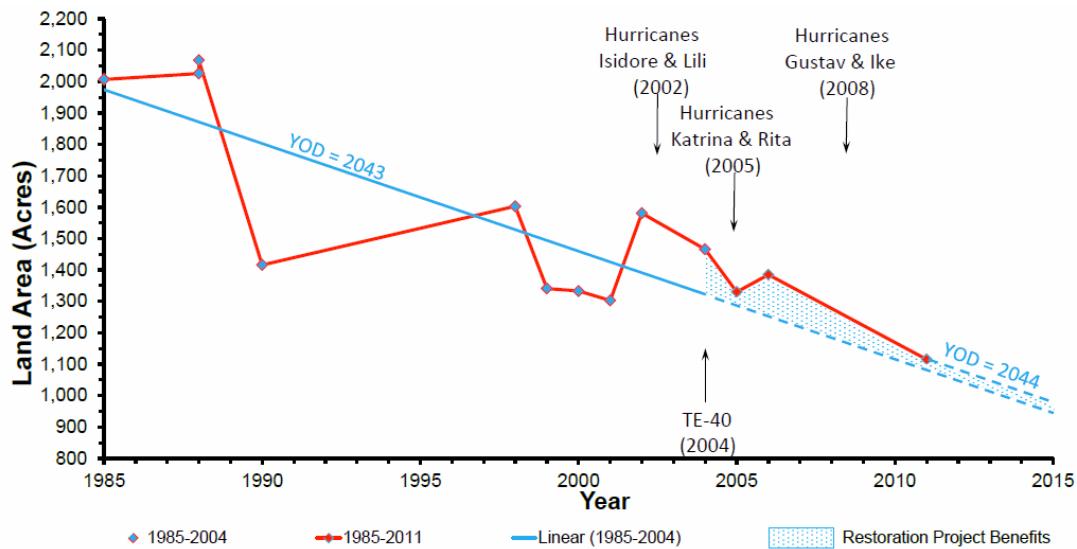

Figure 28. Timbalier Island Land Area Change Analysis (CEC, 2012)

4.3.2 East Timbalier Island

The land area over time for East Timbalier Island is plotted in Figure 29. The island was restored through CWPPRA projects TE-25 and TE-30 in 2000. The pre-restoration YOD was projected to be 2014. Post-restoration, the YOD was projected to be 2018. It is noted that Hurricanes Katrina, Rita, Gustav, and Ike caused significant land loss on East Timbalier Island

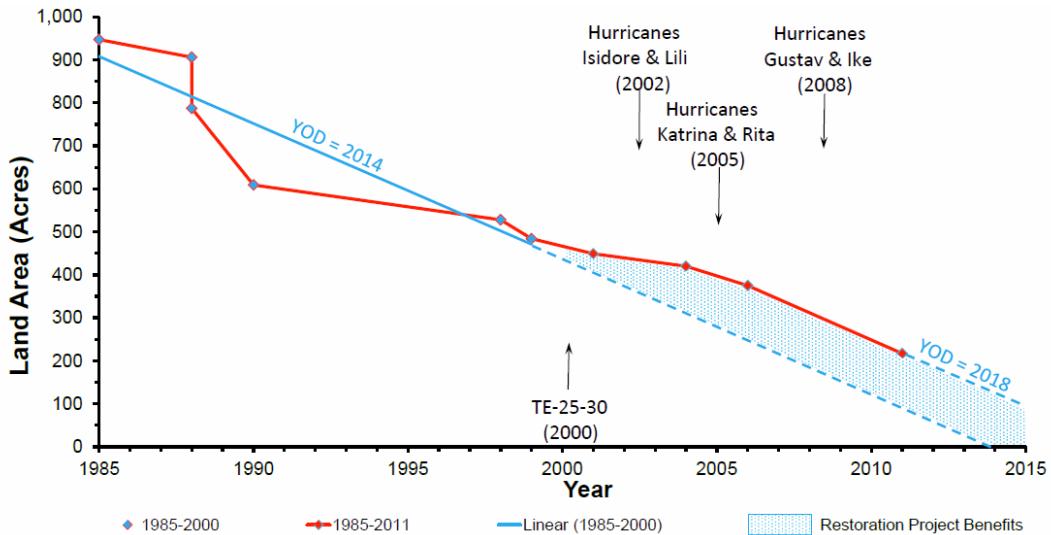

Figure 29. East Timbalier Island Land Area Change Analysis (CEC, 2012)

between 2005 and 2008 (Doran et al., 2009; Martinez et al., 2006). As such, it is expected that the land loss rate would have accelerated, and in absence of the 2000 restoration projects, East Timbalier Island would have disappeared significantly sooner than the 2014 projection.

4.4 Modern Delta Barrier Islands (Cheniere Ronquille to Scofield Island)

The Modern Delta Barrier Islands have benefitted from a number of very recent barrier island restoration projects, in addition to the Emergency Berms that were constructed as a part of the BP oil spill response (Figure 30 and Table 5).

Although BICM did not report estimated disappearance rates for all of these islands, the BICM data presented above through 2005 projected that Shell Island would have disappeared by 2029 (Table 2; Section 5.1). Recent assessment of shoreline erosion rates for the Modern Delta barrier islands suggest that the recent projects constructed by the CPRA have prograded the shoreline positions gulfward relative to their pre- hurricanes Katrina and Rita positions (Figure 31).

Pre-restoration average rates of shoreline erosion ranged from -4.5 ft/yr (Pelican Island) to -41.7 ft/yr (East Grand Terre Island). Post-restoration rates of shoreline erosion range from +12.7 ft/yr (Pelican Island) to +85.9 ft/yr (East Grand Terre Island) noting the higher value for East Grand Terre Island may be related to the fact the project was recently completed in 2010 and the analysis utilized the post-construction survey. For this same time period, the average erosion rate for Chenier Ronquille was -46.1 ft/yr. It is noted that the post-restoration period included the sand berms on Pelican and Scofield Islands, neither of which underwent full island restoration during this time period. These reversals of shoreline change rates, from erosion to accretion, are evidence that the restoration projects have benefitted not only the individual islands, but the system as a whole.

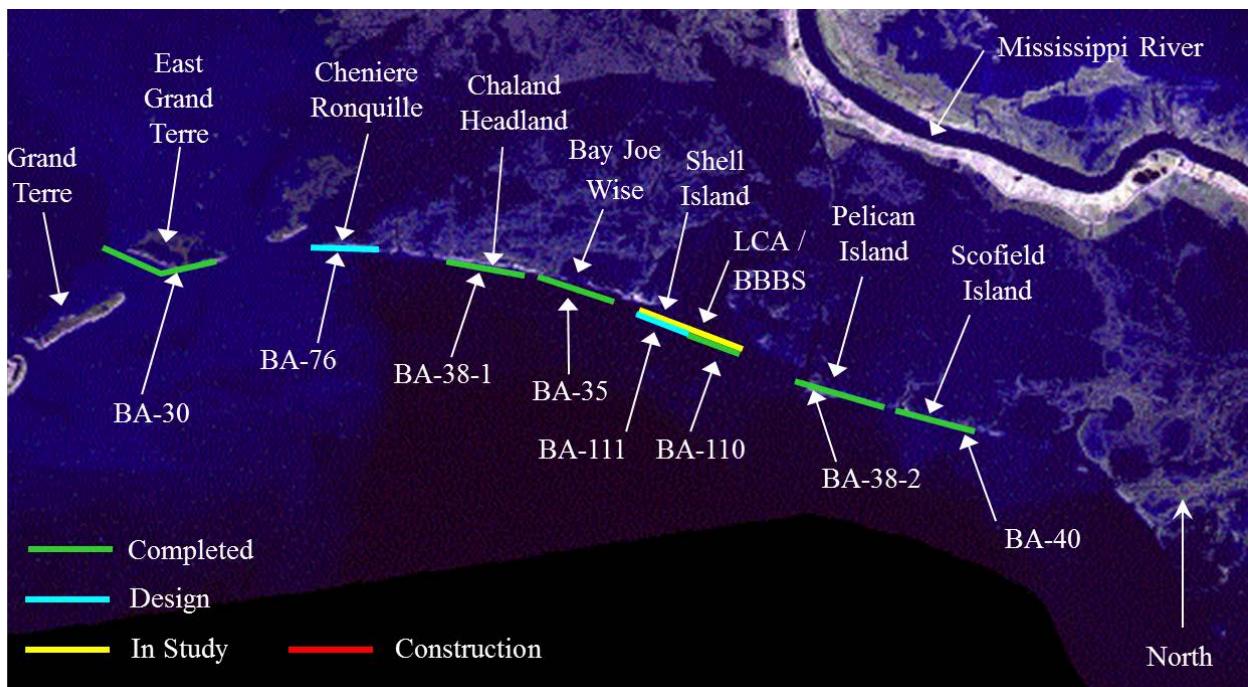

Figure 30. Location of barrier island restoration projects in Lafourche Delta Barrier System (CEC, 2012).

Table 5. List of projects constructed, funded for construction, and for future implementation in the Modern Delta Barrier System.

Barrier Shoreline Restoration Projects	Funding Program	Construction Date
<i>Modern Barrier System</i>		
<i>Constructed Projects</i>		
Vegetative Planting of a Dredged Material Disposal Site on Grand Terre (BA-28)	CWPPRA	2001
East Grand Terre Island Restoration (BA-30)	CIAP	2010
Pass La Mer to Chaland Pass (BA-38-1) also known as "Chaland Headland"	CWPPRA	2007
Pass Chaland to Grand Bayou Pass Barrier Shoreline Restoration (BA-35) also known as "Bay Joe Wise"	CWPPRA	2009
Barataria Barrier Island Complex Project: Pelican Island and Pass (BA-38-2)	CWPPRA	2012
Emergency Berms W8, W9, W10	Berm Funds	2010-2011
Riverine Sand Mining/Scofield Island Restoration (BA-40)	CWPPRA/ Berm Funds	2013
Shell Island Restoration East Berm (BA-110)	Berm Funds	2013
<i>Funded for Construction</i>		
Cheniere Ronquille Barrier Island Restoration (BA-76)	NRDA	TBD
Shell Island Restoration West NRDA (BA-111; in final design)	NRDA	TBD
<i>Future Projects</i>		
BBBS Restoration (BA-10)	LCA	TBD

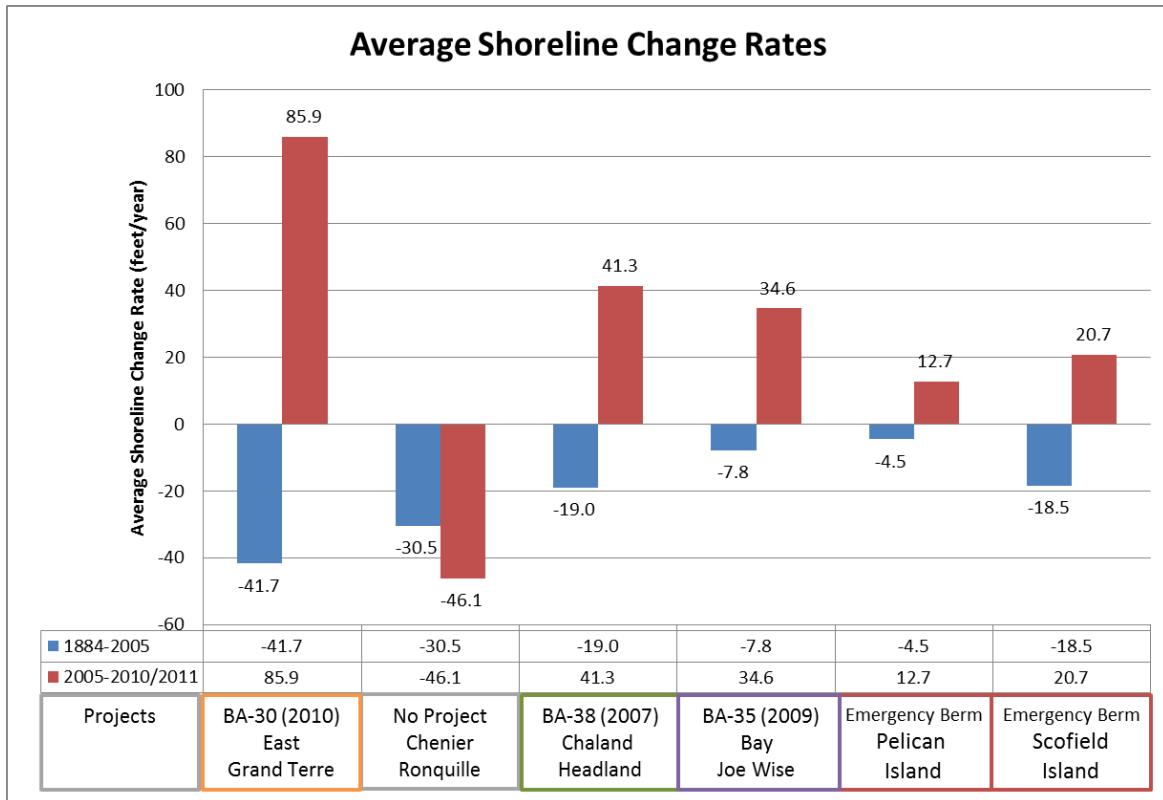

Figure 31. Barrier island average gulf-side shoreline change rates pre-restoration (1884-2005) and post-restoration (2005-2010/2011). Projects constructed (and years) are also listed in the data table.

4.4.1 East Grand Terre

East Grande Terre Island is part of the original Grand Terre Island which has divided into East and West Grand Terre Islands separated by Pass Abel. This island was restored in 2010 through the construction of the East Grand Terre Island Restoration Project (BA-30) by the CPRA with funding from CIAP (CPE, 2011). The East Grand Terre Island Restoration Project was part of the original East and West Grand Terre Island Restoration Project which was cooperatively designed and engineered by the CPRA and National Marine Fisheries Service through the CWPPRA program.

Presented in Figure 32 are the average shoreline change rates for East Grand Terre. The pre-restoration erosion rates ranged from -38.9 ft/yr (BICM short-term) to -48.3 ft/yr (BICM long-term) noting the BICM historical average was on the same order of magnitude equal to -41.7 ft/yr. East Grand Terre has experienced breaching throughout the long-term and short-term intervals. The island experienced net accretion in the near-term interval (+85.9 ft/yr on average) noting this period included the recently completed restoration project. The new historical average, equal to -34.7 ft/yr, is less than the BICM time period averages. Thus restoration of the

island's geomorphic form and function offset a significant percentage of the erosion experienced in the short-term period, returning the historical erosion rate to less than pre-restoration rates.

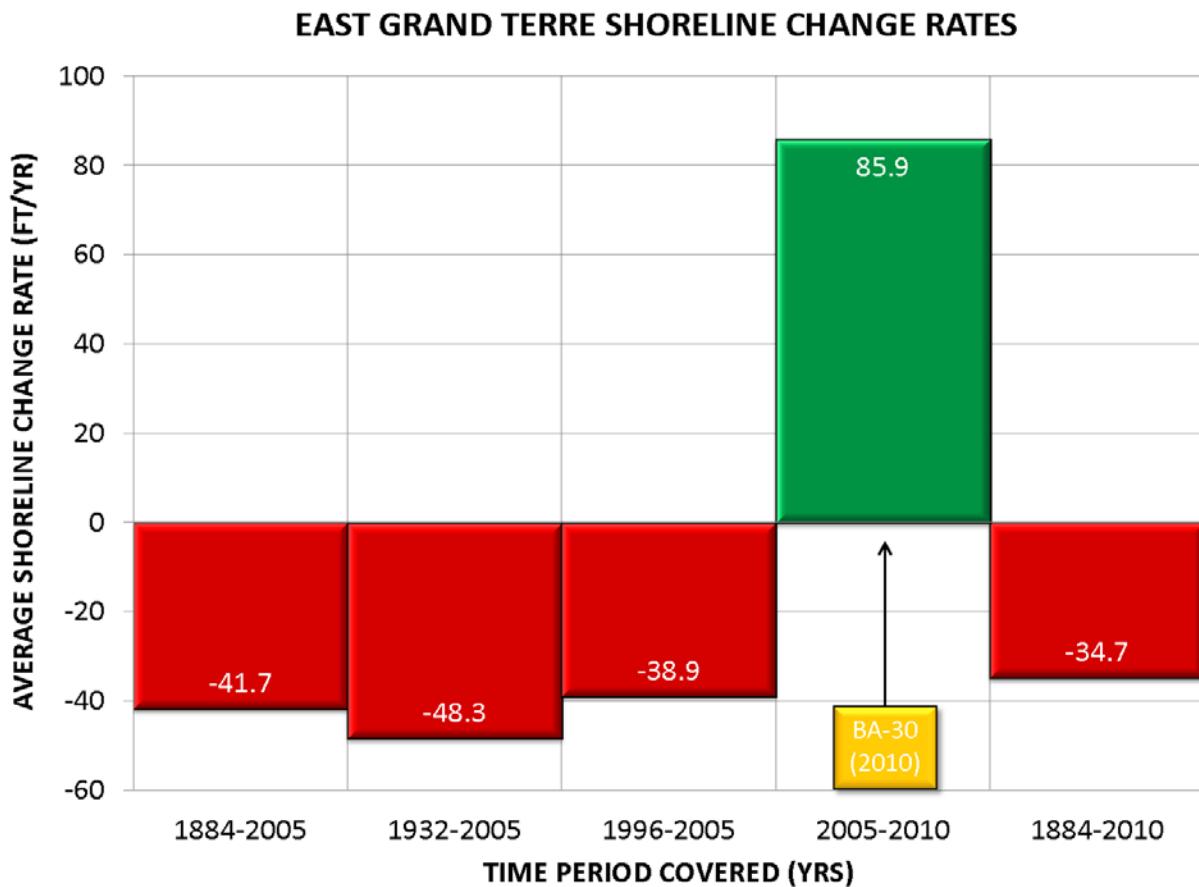

Figure 32. East Grand Terre Average Shoreline Change Rates (CEC, 2012).

4.4.2 Cheniere Ronquille

Presented in Figure 33 are the average shoreline change rates for Cheniere Ronquille. In general the erosion rates have accelerated over time, ranging from -30.5 ft/yr (BICM historical) to -46.1 ft/yr (near-term). Shell Island experienced multiple breaches between 2004 and 2006 attributed to Hurricanes Katrina and Rita. Cheniere Ronquille has not been restored to date, but future restoration projects are planned (BA-76). The new historical erosion rate average, equal to -30.7 ft/yr, is nearly identical to the BICM historical rate.

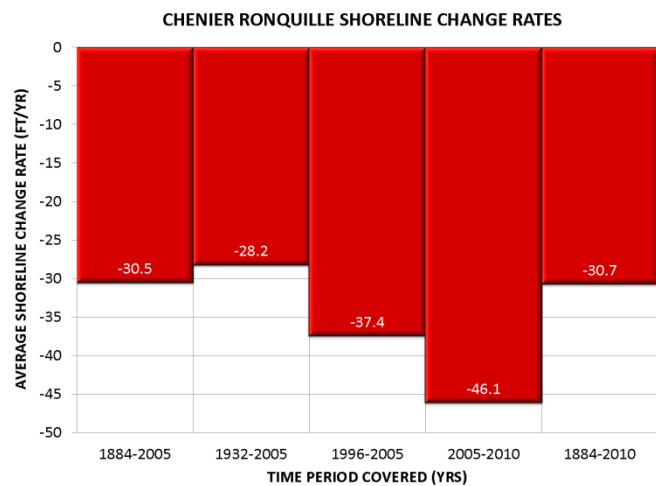

Figure 33. Cheniere Ronquille Average Shoreline Change Rates (CEC, 2012).

4.4.3 Chaland Headland

The Chaland Headland extends from Pass Chaland (now closed) on its eastern end to Pass La Mer on its western end. This headland was restored in 2006 under CWPPRA Project BA-38-2 (CPE, 2008). Presented in Figure 34 are the average shoreline change rates for the Chaland Headland. The pre-restoration erosion rates ranged from -17.4 ft/yr (BICM long-term) to -32.6 ft/yr (BICM short-term) noting the short-term average was over 1.5 times the long-term average and the BICM historical average equal to -19.0 ft/yr. The Chaland Headland first breached between 1998 and 2004 and experienced additional breaching in 2005

attributed to Hurricanes Katrina and Rita, all of which occurred during the short-term interval. This breaching correlates to the amplified shoreline erosion rate. The island experienced net shoreline progradation in the near-term interval (+41.3 ft/yr on average) noting this period included the restoration project. The new historical average shoreline erosion equaled -16.4 ft/yr, which was on the same order of magnitude as the BICM historical and long-term averages. Thus restoration of the island's geomorphic form and function offset a significant percentage of the erosion experienced in the short-term period, returning the historical erosion rate to pre-restoration rates.

4.4.4 Bay Joe Wise

This barrier shoreline extends from Grand Bayou Pass (now closed) on its eastern end to Pass Chaland on its western end. This headland was restored in 2008-2009 under CWPPRA Project BA-35 (CEC, 2010) entitled Pass Chaland to Grand Bayou Pass Barrier Shoreline Restoration. Presented in Figure 35 are the average shoreline change rates for the Bay Joe Wise Headland. The pre-restoration erosion rates ranged from -5.0 ft/yr (BICM long-term) to -27.1 ft/yr (BICM short-term) noting the short-term average was over 5 times the long-term average and over 3 times the BICM historical average equal to -7.8 ft/yr. Bay Joe Wise first breached between 1998 and 2004 and experienced additional breaching in 2005 attributed to Hurricanes Katrina and Rita, all of

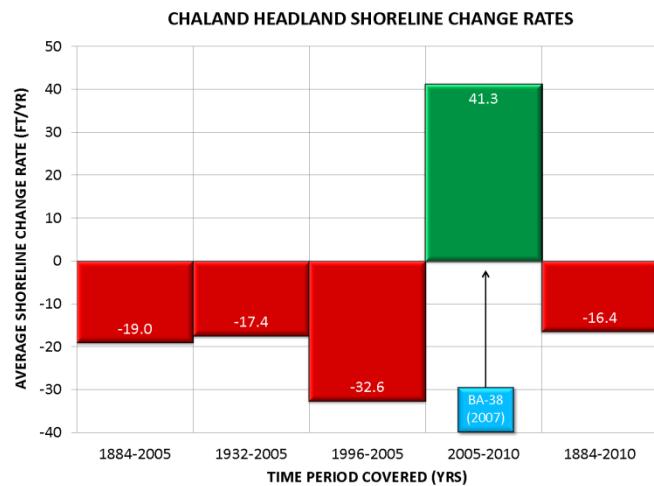

Figure 34. Chaland Headland Average Shoreline Change Rates (CEC, 2012).

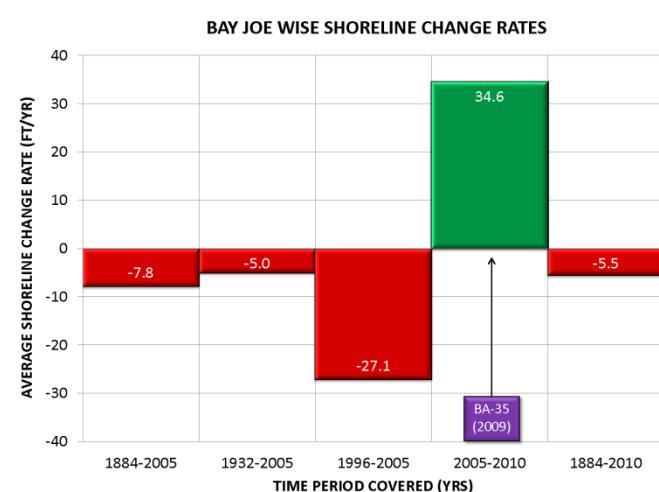

Figure 35. Bay Joe Wise Headland Average Shoreline Change Rates (CEC, 2012).

which occurred during the short-term interval. This breaching correlates to the amplified shoreline erosion rate. The island experienced net accretion in the near-term interval (+34.6 ft/yr on average) noting this period included the restoration project. The new historical average equaled -5.5 ft/yr, which was on the same order of magnitude as the BICM historical and long-term averages. Thus restoration of the island's geomorphic form and function offset a significant percentage of the erosion experienced in the short-term period, returning the historical erosion rate to pre-restoration rates.

4.4.5 Shell Island

Presented in Figure 36 are the average shoreline change rates for Shell Island. The erosion rates ranged from -74.9 ft/yr (BICM historical) to -355.6 ft/yr (BICM short-term) noting the short-term average was over 4.5 times the historical average and over 3.5 times the BICM long-term average equal to -94.8 ft/yr. Shell Island first breached between 1884 and 1922 and continued to divide into multiple islands as it disintegrated over time. Shell Island's high erosion rate is in part attributed to the Empire Waterway jetties which interrupt the natural alongshore transport from east to west.

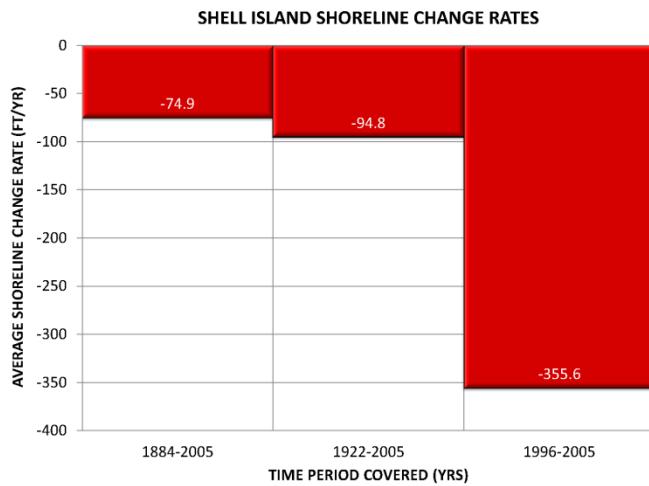

Figure 36. Shell Island Average Shoreline Change Rates (prior to Emergency Berm construction; CEC, 2012).

The initial template of emergency berm reach W8 was located within the footprint of the Shell Island restoration project which was proposed under the LCA – BBBS project. However, pre-construction surveys indicated that the island had receded, so the profile was shifted approximately 750 feet north (landward). The construction template for the W8 berm reach was identical to the templates used on the other berm reaches: a 20-foot crest width, +5 feet, NAVD 88 crest elevation, 1V:25H side slopes above -2.0 feet, NAVD 88 and 1V:50H below -2.0 feet, NAVD 88. Construction of approximately 9,000 linear feet of berm on Shell Island started on October 9, 2010 and was completed by November 23, 2010. Approximately 790,000 cubic yards of sand was placed along the island. Monitoring of emergency sand berm reach W8 indicates that 83% of the material had been retained after the first 360-day monitoring event.

4.4.6 Pelican Island

Presented in Figure 37 are the average shoreline change rates for Pelican Island. It is noted this island benefitted by emergency Sand Berm W9 (Thompson. 2012). The pre-berm erosion rates ranged from -4.5 ft/yr (BICM historical) to -40.5 ft/yr (BICM short-term) noting the short-term average was 9 times the historical average and over 2.5 times the BICM long-term average equal to -16.2 ft/yr. Pelican Island first breached between 1998 and 2004, which occurred during the short-term interval. This breaching correlates to the amplified shoreline erosion rate. The island experienced net shoreline progradation in the near-term interval (+12.7 ft/yr on average) noting this period included the sand berm construction. The new historical average equaled -3.8 ft/yr,

which was on the same order of magnitude as the BICM historical average. Thus placement of the sand berm restored some of the island's geomorphic form and function, returning the historical erosion rate to pre-breach rates.

Construction of emergency berm reach W9 along Pelican Island started on July 18, 2010 and was completed by October 2, 2010. Sand was transported from re-handling area 35-E and emplaced within the construction template, which was identical to the template used for the other berm reaches. The template was superimposed on the existing island and within the footprint of the proposed CWPPRA Pelican Island Restoration Project (BA-38-2). A total length of 12,700 feet of berm was constructed and approximately 1,294,000 cubic yards of sand was emplaced within the berm along Pelican Island. Monitoring of emergency sand berm reach W9 indicates that 79% of the material had been retained after the first 360-day monitoring event.

4.4.7 Scofield Island

Presented in Figure 38 are the average shoreline change rates for Scofield Island. Similar to Pelican Island, it is noted this island was the site of emergency berm W10 as part of the Louisiana Berm Project (Thompson, 2012). The pre-berm erosion rates ranged from -11.7 ft/yr (BICM long-term) to -30.2 ft/yr (BICM short-term) noting the short-term average was over 2.5 times the long-term average and over 1.5 times the BICM historical average equal to -18.5 ft/yr. Scofield Island first breached between 1998 and 2004, which occurred during the short-term interval.

This breaching correlates to the amplified shoreline erosion rate. The island experienced net shoreline progradation in the near-term interval (+20.7 ft/yr on average) noting this period included the sand berm. The new historical average equaled -17.0 ft/yr, which was on the same order of magnitude as the BICM historical average. Thus placement of the sand berm restored some of the island's geomorphic form and function, returning the historical erosion rate to pre-breach rates.

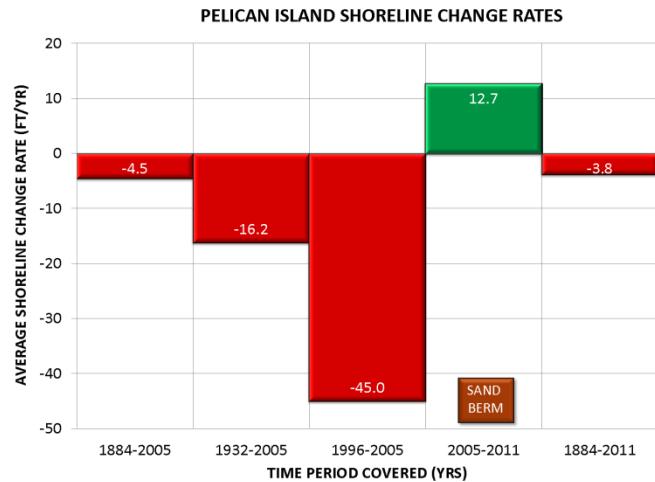

Figure 37. Pelican Island Average Shoreline Change Rates (CEC, 2012).

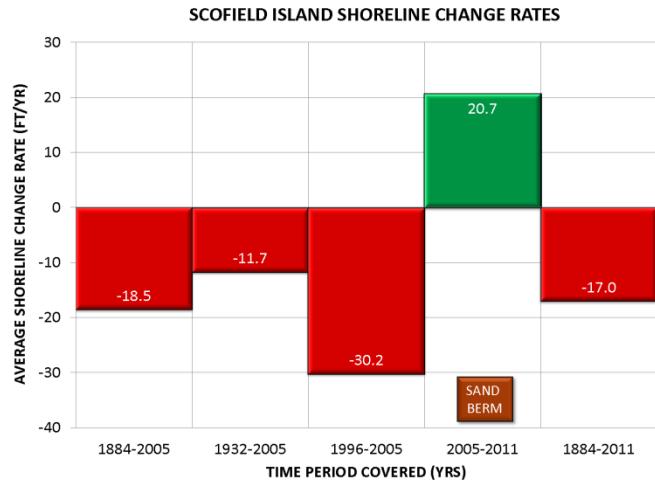

Figure 38. Scofield Island Average Shoreline Change Rates (CEC, 2012).

Construction of berm reach W10 on Scofield Island started on September 13, 2010. Approximately 935,000 cubic yards of sand was transported from rehandling site 25-5 between September 13 and November 23, 2010 for constructing approximately 14,755 feet of berm. The construction template for berm reach W10 was identical to the other berm reaches. The berm was constructed within the footprint of the proposed CWPPRA Scofield Island Restoration Project (BA-40). Monitoring of emergency sand berm reach W10 indicates that 91% of the sand had been retained after the first 360-day monitoring event.

4.5 St. Bernard Delta Barrier Islands

Emergency Berm Reach E4 was constructed adjacent to the northern Chandeleur Islands. Dredging operations in the Hewes Point borrow site (Figure 39 and Table 6) commenced after the state received the notice to proceed on June 11, 2010 and ended by March 21, 2011. For the northern section of berm reach E4, sand was pumped directly by dredging from the approved borrow areas in Hewes Point. Once adjacent to the island, the sand was shaped into the final berm alignment using grader equipment. All work performed by the equipment at the berm site

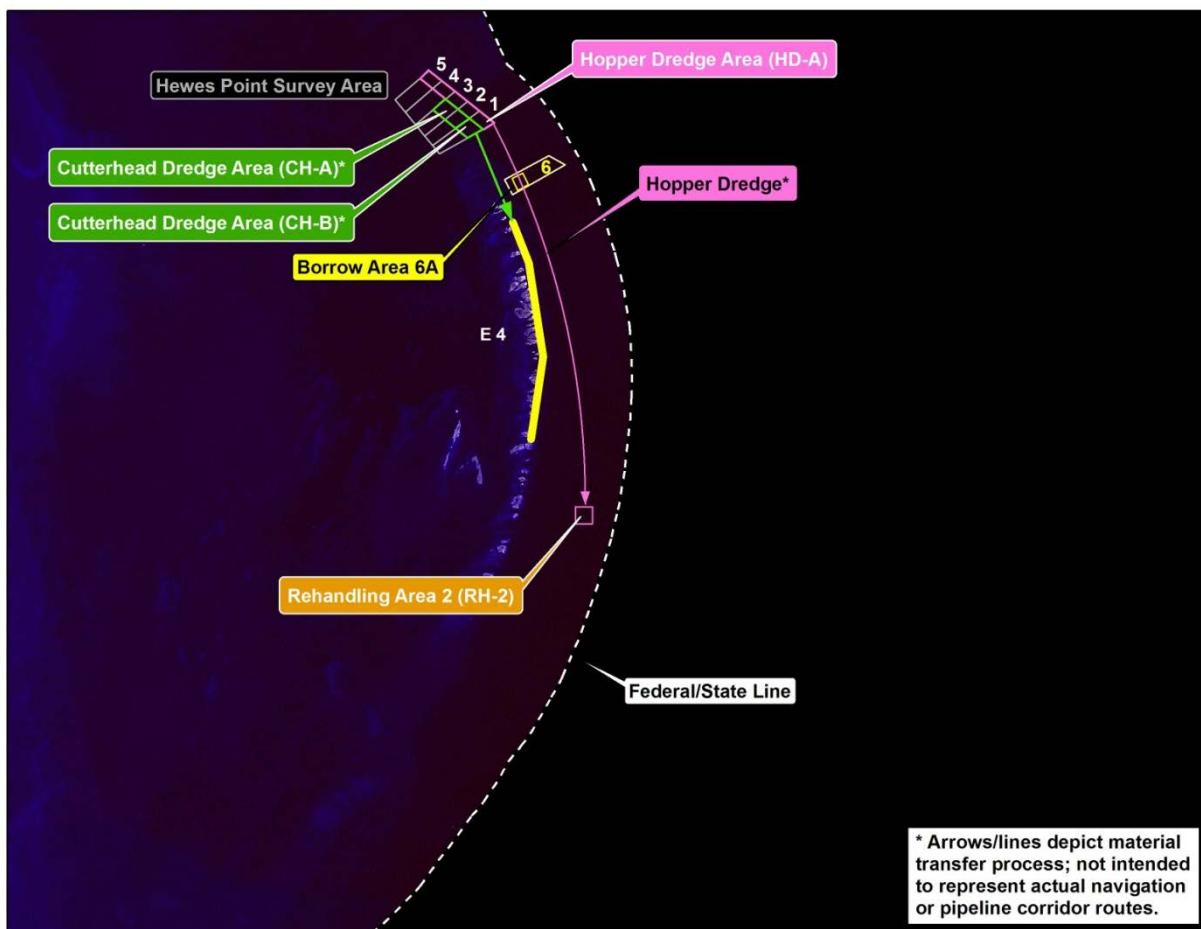

Figure 39. Location of emergency Berm E4 and surrounding features in the vicinity of the Chandeleur Islands.

Table 6. List of projects constructed, funded for construction, and for future implementation in the St. Bernard Delta Barrier System.

remained within the footprint of the berm section or seaward of the berm. Sand for the southern portion of berm reach E4 was transported via hopper dredge from Hewes Point and emplaced in rehandling area RH-2 (Figure 39).

The berm template has a dune height of +5 feet, NAVD 88 with a crest width of 20 feet. Side slopes of 1V:25H were constructed above -2.0 feet, NAVD 88, while a construction slope of 1V:50H was applied below -2.0 feet, NAVD 88. Initially, the berm was constructed so that the landward toe of fill was located 100 feet seaward of the mean high water line. However, this requirement was adjusted starting at Station 187+11 so that the berm could be constructed along the shoreline. This reduced the fill density necessary to construct the berm template.

A total of 47,000 feet (8.9 miles) of berm was constructed along the Chandeleur Islands. Construction of the berm along Chandeleur Island (Reach E4) placed approximately 3,170,000 cubic yards of sandy material from Hewes Point. The shoreline was extended an average of 430 feet and numerous breaches were plugged.

Based on the 360-day monitoring survey, approximately 77% (2,450,000 cubic yards) of the sediment remains within the initial fill footprint. Although comparison of the as-built survey and the 360-day monitoring survey suggests that there has been a volumetric loss of 720,000 cubic yards, this anomaly could be at least partially attributed to survey error. The shoreline has remained stable such that the average shoreline position is roughly five feet seaward of the as-built shoreline position. It should be noted that as of the 360-day monitoring survey, the berm had not been subjected to a significant storm event with the exceptions of Tropical Storm Lee and Tropical Storm Debby. Shoreline recession and erosion are highest at the center of the constructed island where the largest landmass existed prior to construction.

There has been a measurable reduction in the berm crest elevation, likely due to overwash. It is estimated that more than 50% of the overwash occurred between the as-built and 30-day monitoring surveys. It is thought that this overwash is a result of nor'easter storm events and the island adjusting to an equilibrium elevation. Overwash is not considered a loss of sand as the sand stays within the system.

4.6 Factors affecting Barrier Island Stability

Figure 40 illustrates the major pathways for sand movement, which affect barrier island stability. These sediment pathways are discussed below.

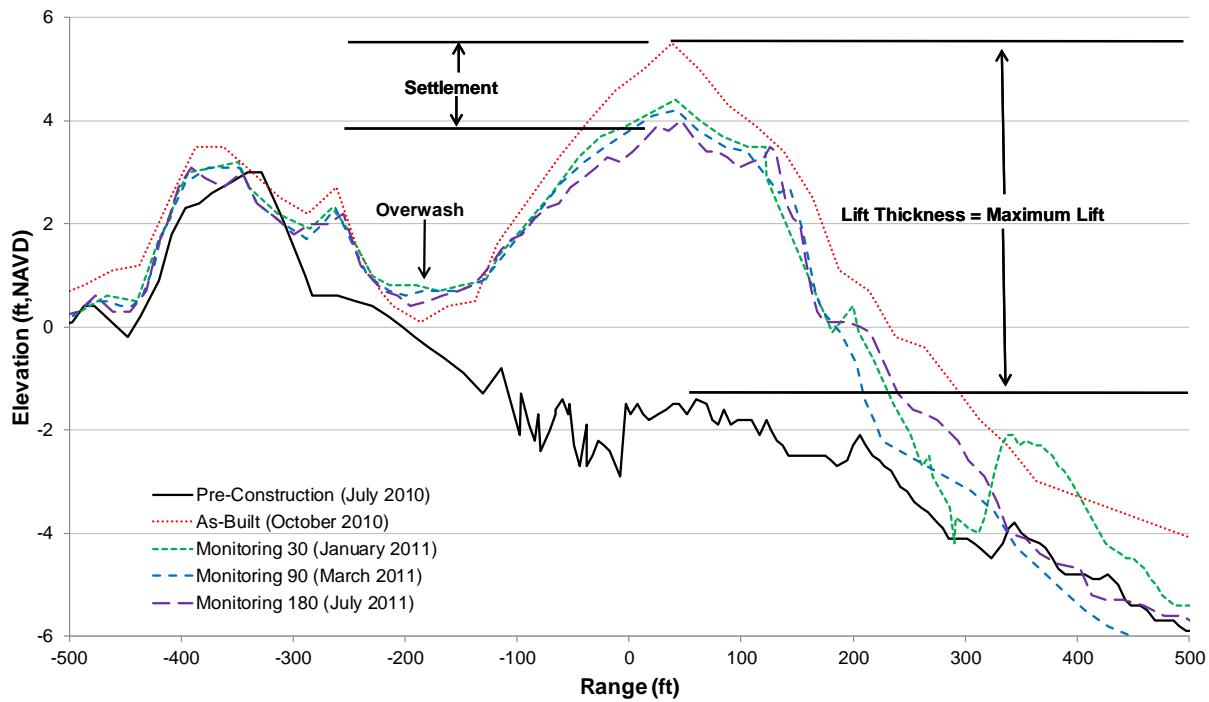

Figure 40. Illustration of various sediment movement pathways which contribute to barrier island stability.

4.6.1 Settlement

In addition to hydrodynamic processes, consolidation of the underlying substrate (settlement) lowers the profile elevation suggesting an apparent volumetric loss of material. This apparent loss is not the result of material leaving the placement area, but is the result of material sinking in place. It is critical to understand the extent of this process because ignoring it could attribute a greater volume change to other processes, such as longshore transport, than is actually occurring.

Rosati's (2009) research suggests that consolidation under the weight of a barrier island is a dominant process governing morphologic evolution and migration. Results indicate that the volume of sand that is sequestered through the consolidation process can be as large as 68 percent for a barrier island overlying a poorly consolidated substrate, such as would occur for new construction of a barrier island (or sand berm) over a compressible substrate.

4.6.2 Overwash

Overwash is a significant component of the sediment budget, although overwash is not considered a loss from the system. As it is a redistribution of sediment, it describes the performance of the project and explains observed sediment redistribution. Overwash can be calculated by measuring the volume change landward of the location of maximum elevation on

the as-built survey. The overwash density (and corresponding volume when calculating volumes using the average end area method) was obtained by calculating the volume change landward of the project between the as-built and monitoring profiles.

4.6.3 Offshore Loss of Fine Sediment

Fine-grained sediment (silt and clay) is more easily resuspended by waves and transported offshore than coarse-grained sediment (sand). Some barrier island projects are constructed with a mixture of sand, silt, and clay. Silts and clays can be used to effectively construct back-barrier marsh platforms, but are highly erosive on the shoreface of barrier islands. A distinction must be made within a sediment budget to account for the difference in sediment types. From a coastal engineering perspective, it is the volume of sand within the system that is important because the sand provides longer term protection from wave attack. When silt and clay are exposed they are more easily suspended in the water column and can be transported offshore.

4.6.4 Longshore Transport

The losses due to longshore transport (sediment moving along the shoreline) can be estimated by taking the total measured volume change between surveys and subtracting the offshore loss. Longshore transport is the process which typically results in sediment being deposited in navigation channels that bisect barrier islands. The slope of the longshore transport curve indicates whether erosion or accretion is occurring and the severity of this erosion or accretion. Areas of higher erosion (or accretion) will result in a steeper longshore transport curve. Stable areas will result in a flatter longshore transport curve.

4.6.5 Island Breaching

It is noted that the period of time when shoreline erosion rates increased dramatically above the historical averages corresponds with breaching of the barrier shorelines. These periods of time correlated with the passage of significant hurricanes and resultant breaching of shorelines. Often times these breaches occurred adjacent to canals which act as sediment sinks when the beach has overwashed and sediments deposited in the canals. The sediments are no longer available for transport and in essence are removed from the littoral system.

Recent studies have documented that breaching of islands contributes to accelerated shoreline erosion and island disintegration. Numerous barrier island breaches caused by hurricanes over the past seven years have benefitted by recent restoration projects, which in many cases, have returned islands to their historic shoreline positions. The CPRA is developing a Breach Management Program in response to this recommendation. Refer to Section 3.4 (above) for more information.

4.7 Minimized Design Template

The minimized design template is defined as a design template with minimal barrier island dimensions that restores the barrier shoreline's geomorphic form and ecologic function and retains this form and function after being subjected to the design storm events. There are several

components needed to construct the minimized design template for a barrier system including bathymetric/topographic data, sediment transport pathways, design storm criteria, subsidence and compaction, existing restoration project footprints, and site constraints (e.g., unique environmental habitats).

A minimized design template was developed for the Terrebonne Basin barrier shorelines extending from East Timbalier Island to Raccoon Island as part of the Louisiana Coastal Area program for the Terrebonne Basin Barrier Shoreline Restoration Project (TBBSR) (USACE, 2010). The design storms selected included a hypothetical 50-year design storm and historic storms, Hurricanes Katrina and Rita, which occurred in 2005, and Hurricanes Gustav and Ike, which occurred in 2008. Table 7 presents dimensions of the minimized restoration template developed for the Terrebonne Basin islands.

Table 7. Summary of Minimized Restoration Templates for TBBSR

Island	Raccoon	Whiskey	Trinity	East	Timbalier	East Timbalier
Gulf-side Beach Width (ft)	250	250	250	250	250	250
Dune Crest Width (ft)	100	100	100	100	100	100
Bay-side Beach Width (ft)	100	100	100	100	100	100
Marsh Width (ft)	1,000	1,000	1,000	1,000	1,000	1,000
Beach Elev. (ft, NAVD88)	4.2	4.0	4.0	4.0	4.0	4.0
Dune Elev. (ft, NAVD88)	6.4	6.2	6.2	6.2	6.2	6.2
Marsh Elev. (ft, NAVD88)	2.5	2.1	2.3	2.3	2.2	2.3

A number of barrier island projects have been constructed in the Teche, Lafourche, and Modern delta reaches since 1994. With the recent updating and adoption of the 2012 *Louisiana's Comprehensive Master Plan for a Sustainable Coast* (CPRA, 2012), it is timely to consider the status of the already-accomplished restoration projects. In order to improve the understanding of barrier system evolution and enhance the science behind barrier system restoration design, it is both essential and prudent to evaluate performance of the constructed projects as completed in the recently-commissioned barrier island performance study (CEC, 2012).

4.8 Benefits of BI Restoration on Longevity of System(s)

With several major restoration projects in place, the post-restoration estimated Year of Disappearance (YOD) for several barrier island systems in Louisiana have been extended by years to decades. This increase in island longevity throughout the system is a direct benefit of the restoration projects. Further, with the increase in both frequency and intensity of major hurricanes over the past 12 years (and similar projections into the future), in the absence of the

restoration and protection program, it is expected many of these islands would have disappeared much sooner than original projections.

5.0 Future Plans

Future plans for Louisiana's barrier islands include additional projects, continuation of system-wide monitoring, and the management of relevant sediment and geophysical data, and overall understanding of sediment management requirements to support the sediment needs of the 2012 Coastal Master Plan projects.

5.1 Projects

In addition to the “Future Projects” listed above in Section 2, the 2012 Coastal Master Plan identifies barrier island restoration projects in four main groupings. These projects are listed as: Isles Dernieres Barrier Island Restoration (from Raccoon Island to Wine Island); Timbalier Islands Barrier Island Restoration (from Timbalier Island to Belle Pass); Belle Pass to Caminada Pass Barrier Island Restoration; and Barataria Pass to Sandy Point Barrier Island Restoration. In addition to these projects, eight of the 13 NRDA Early Restoration Projects that Louisiana has submitted are barrier island projects:

- 1) Cheniere Ronquille
- 2) Grand Isle Bayside Breakwaters
- 3) West Grand Terre Beach Nourishment
- 4) West Grand Terre Stabilization
- 5) Barataria Basin Barrier Shoreline – Caminada Headland
- 6) Caillou Lake (Whiskey Island)
- 7) Chandeleur Island Restoration
- 8) Shell Island Restoration

These projects will be prioritized for development and for construction in the near future.

5.2 Monitoring

As discussed above in Section 3.1, the Barrier Island Comprehensive Monitoring (BICM) program has provided an extremely useful baseline of barrier island condition. Now that we have this tremendous tool, there is a need to continue this effort to assess how the islands continue to change over time. The CPRA will continue BICM with a second increment of data collection over the next five years, referred to as BICM2 (Figure 14). Also as discussed in Section 3.6 monitoring of subsidence (Phase 4) due to emplacement of sand during barrier island restoration will continue under Caminada-Moreau Subsidence Study.

5.3 Louisiana Sand Resources Database (LASARD)

The Coastal Protection and Restoration Authority developed the Louisiana Sand Resources Database (LASARD) to archive, populate, and maintain the geoscientific and related data acquired for ecosystem restoration on a GIS platform. The objective of LASARD is to centralize relevant data from various sources for better project coordination. That will facilitate future

planning for delineating and utilizing sediment resources for a sustainable ecosystem restoration in coastal Louisiana by streamlining access to existing data sources, which will minimize the cost and time required to identify appropriate resources. To keep pace with the large amount of data being delivered to the CPRA from ongoing projects, the current LASARD database will need to be updated to incorporate these new data sets. Keeping LASARD current will provide the benefit of real cost savings to upcoming projects by not only providing valuable data for planning, but also by reducing the potential for costly, redundant data collection efforts. This will include finalizing updates to the LASARD attribute formats, updating existing data to match these new formats, and processing additional data sets that are generated by ongoing implementation of coastal restoration projects. The data which has been collected during BICM 1 and which will be collected in future studies will ultimately reside in LASARD. The LASARD database, along with the mapping of surficial sediment distribution, is an important component of the Louisiana Sediment Management Plan (LASMP).

5.4 Louisiana Sediment Management Plan (LASMP)

To ensure the timeline as described in the 2012 Coastal Master Plan for reversing the trend of coastal land loss is realized, the state must depend upon sound environmental and fiscal management of sediment resources. As such, introduction of river sediment and freshwater nutrients to coastal marshes must be an integral component of restoration efforts, and sand deposits associated with ancient distributary channels and remnant shoals formed during the destructive phase of delta evolution should continue to be pursued as viable sources for barrier island and back-barrier marsh restoration. Moreover, sediment needs are likely to increase due to rapid subsidence in south Louisiana and potential increases in sea-level rise over the next century. Thus, the success of restoration efforts depends on locating, managing, and utilizing sediments in a cost-effective manner. One of the metrics the state has chosen to track their progress is average rate of land change for the next 50 years. The goal is to change the trajectory of land loss from net loss to one of net gain by the year 2042.

Khalil and Finkl (2009) and Khalil et al. (2010) stressed the importance of developing and implementing a sediment management plan for coastal Louisiana in support of coastal restoration efforts. Developing a clear understanding of the evolutionary processes controlling coastal sedimentation in deltaic environments is critical to any successful sediment management strategy. This involves direct knowledge of natural coastal processes (e.g., sea level change, subsidence, wave and current energy, sedimentation patterns, and geologic controls) and the impact of engineering activities (e.g., dredging/channels, levees/dams) on these processes.

Effective restoration efforts should be consistent with natural system evolution. Ultimately, one must understand the imbalance between sediment input and erosion (energy required to mobilize and transport sediment) to properly evaluate net sediment movement within wetlands to design effective restoration strategies. The CPRA is focused on long-term conservation and management of state natural resources. As part of this focus, the CPRA developed the Louisiana Sediment Management Plan (LASMP) framework that embraces a regional sediment management strategy upon which restoration projects are planned within a regional purview as opposed to merely a project-focused approach.

LASMP is a working model to incorporate the influence of scale on resource availability (river, in-shore, and continental shelf) and resource distribution for effective restoration. Although technical considerations associated with sediment borrow areas, river sediment, and engineering activities are critical for successful plan implementation, coastal policy/regulation requirements are expected to have significant influence on plan implementation.

The desired result of LASMP is a more cost-effective implementation of the Master Plan via comprehensive management of renewable and non-renewable sediment resources; a reduction in project costs and environmental impacts; and a long-term, safe and sustainable coast to protect Louisiana communities, national critical energy infrastructure, and state natural resources for future generations.

Caernarvon & Davis Pond Operational Plans for 2015

CAERNARVON OPERATIONAL PLAN 2015

From December through May, the intent is to operate the diversion to maintain the seasonal average salinity at the 15 ppt line illustrated in the map below. A salinity gauge has not existed at the 15 ppt isohaline line, though one has been installed closer to the line in May 2014 (USGS gauge #073745275, Black Bay nr Stone Island). Salinities at the Stone Island gauge will be monitored in 2015, but December- May operations will continue to be based on data from the Black Bay gauge specified by the map (Figure 1) and graph below (Figure 2). From June through November, Caernarvon operations will be based on the monthly salinity range at the 5 ppt line specified by the map (Figure 1) and graph (Figure 3) below, utilizing the Crooked Bayou gauge. The structure will be operated when the 14-day moving average salinity is within or above the long term data range for the gauge(s) in use. When the moving average drops below the low trigger (the greater of the long term average minus 1SD or 5ppt) the diversion operations will be ceased until the moving average re-enters the operational range*. Operational settings are not to exceed 7500 cfs.

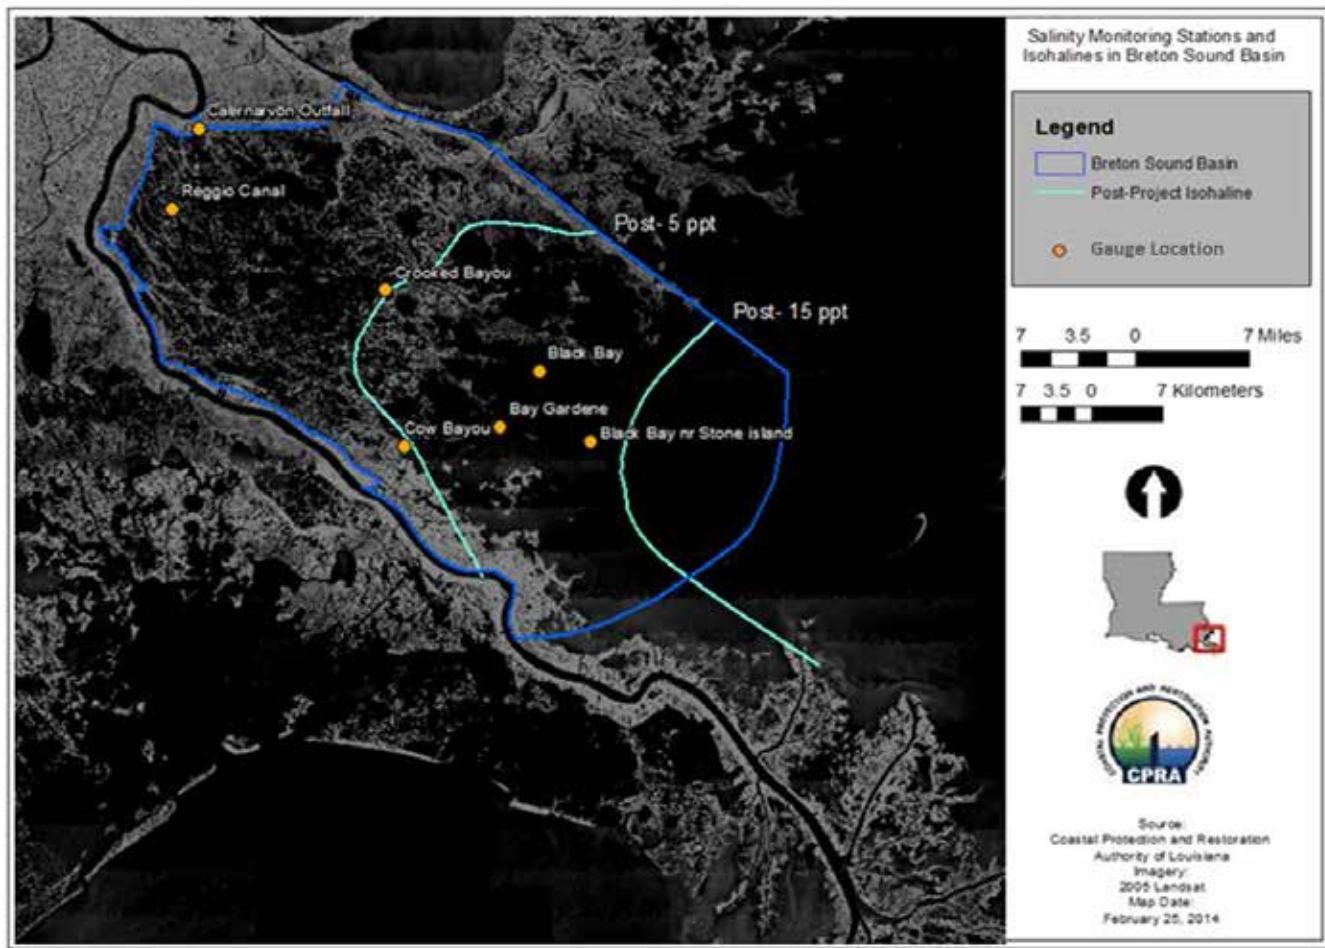

Figure 1. Map of salinity gauges and isohaline lines in Breton Sound basin to be used for guidance and operation of the Caernarvon Freshwater Diversion.

Caernarvon Operations Range: December- May Black Bay Gauge

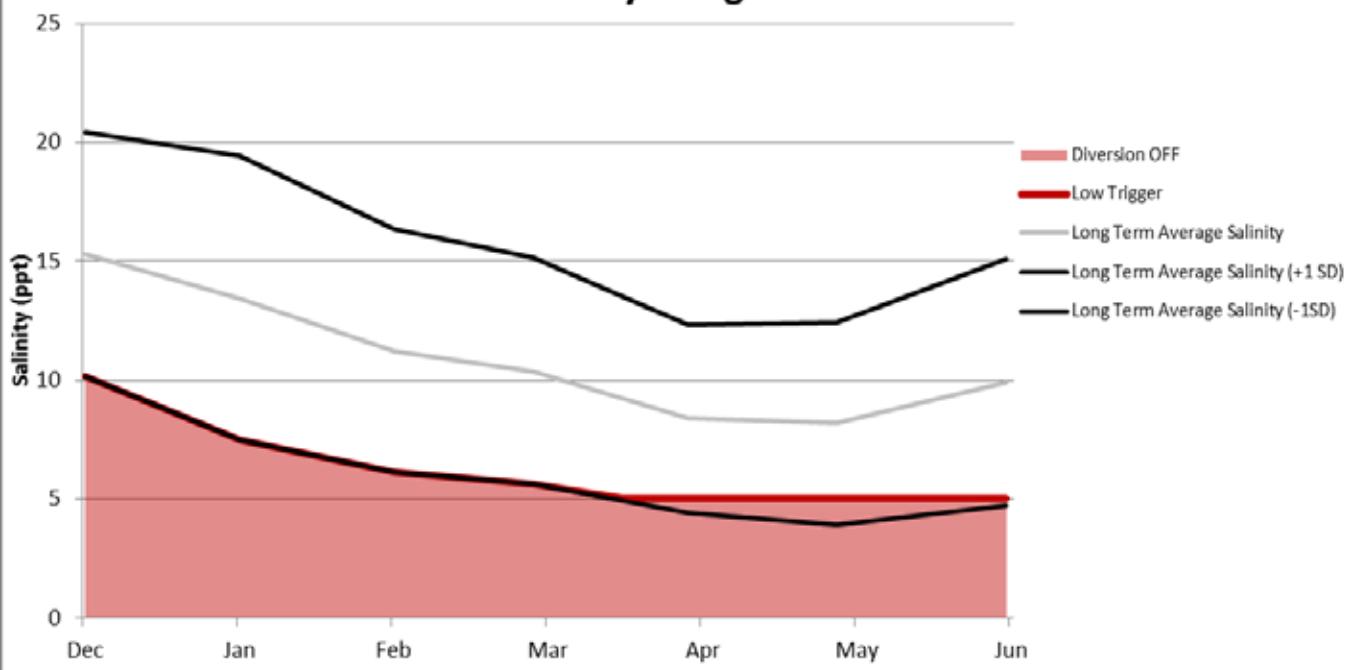

Figure 2. Long term average (+1 standard deviation) salinities from the Black Bay Gauge (USGS site 07374526). From December through May the Caernarvon Freshwater Diversion structure may be operated when the 14-day moving average salinity is within or above the data range. Operations will cease if the moving average drops below the low trigger.*

Caernarvon Operations Range: June-November Crooked Bayou Gauge

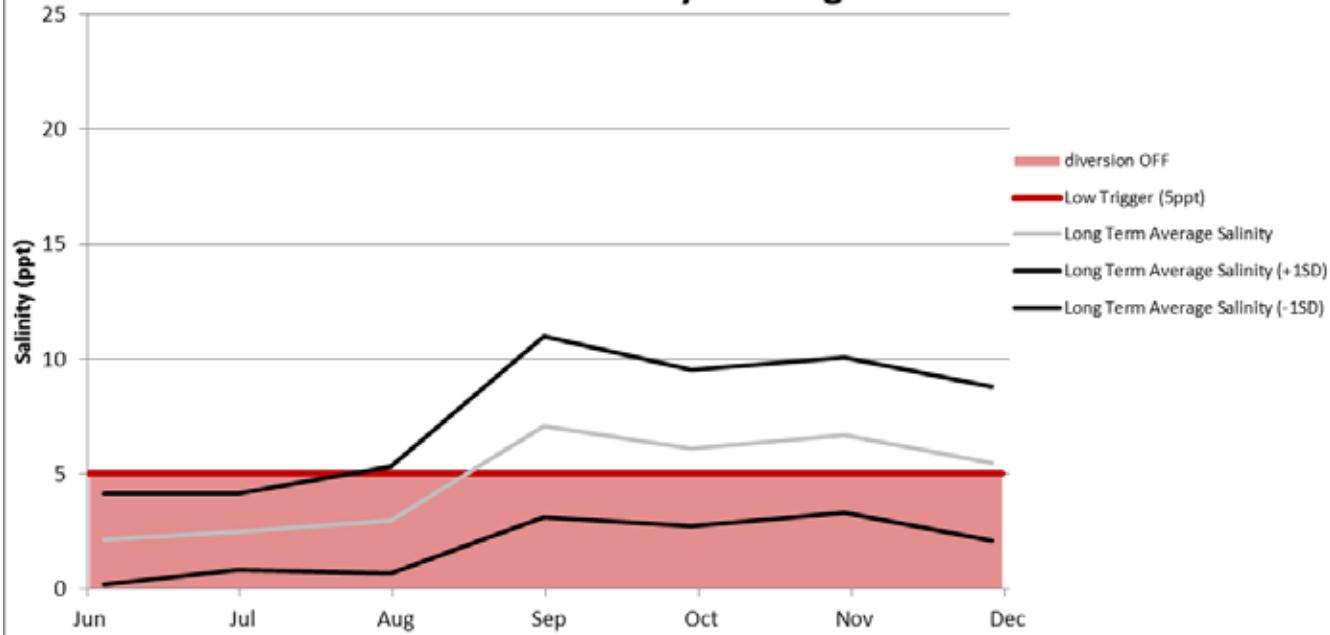

Figure 3. Long term average (+1 standard deviation) salinities from the Crooked Bayou (USGS site 073745257) and Cow Bayou (USGS site 073745258) gauges. From June through November the Caernarvon Freshwater Diversion structure may be operated when the 14-day moving average salinity is within or above the data range. Operations will cease if the moving average drops below 5ppt.*

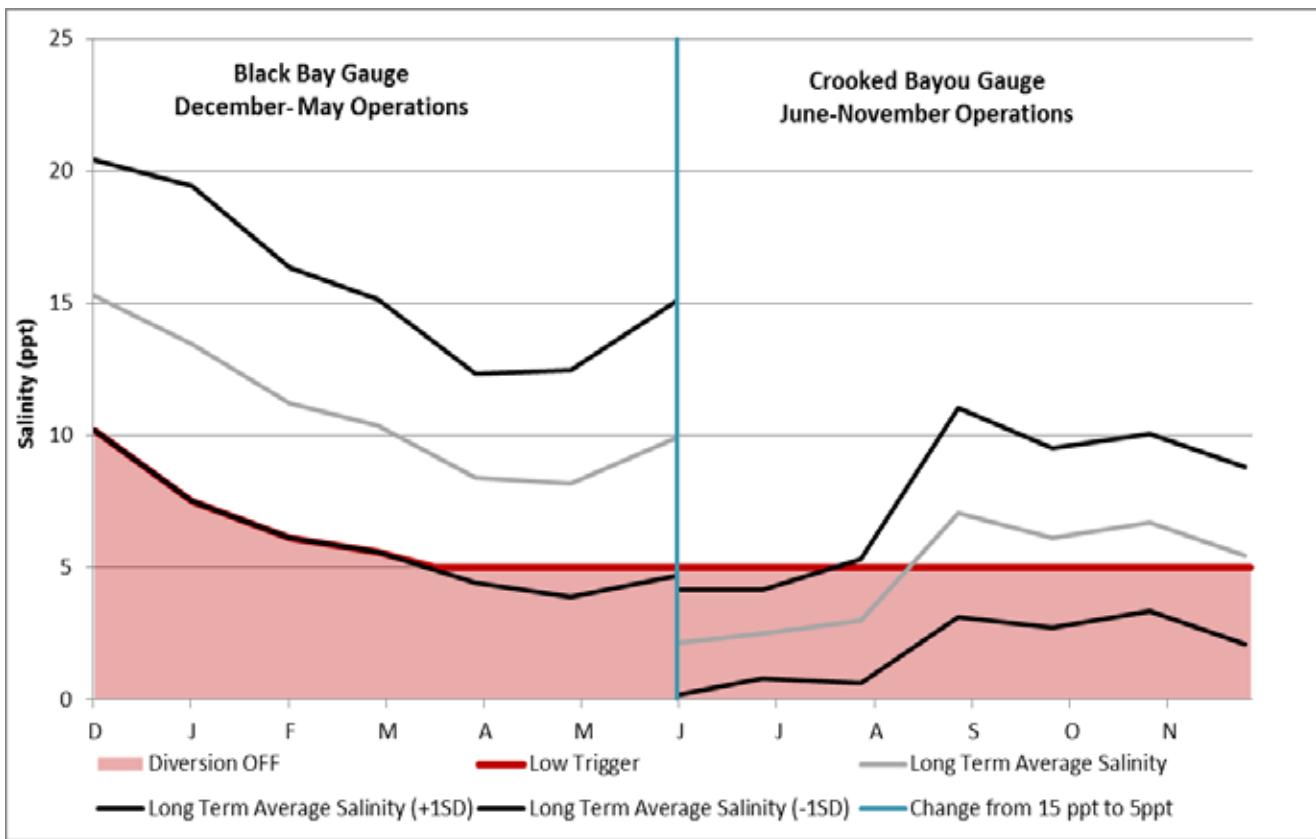

Figure 4. Long term average (+1 standard deviation) salinities from the Black Bay Gauge (USGS site 07374526), from December through May, and the Crooked Bayou (USGS site 07374527) gauge from June through November. The Caernarvon Freshwater Diversion structure may be operated when the 14-day moving average salinity is within or above the data range. Operations will cease if the moving average drops below the low trigger. *

* Discharges may deviate from operational plan as outlined below:

- Emergency, maintenance and local parish situations will be evaluated on a case-by-case basis to determine operational needs. The CIAC shall be notified if operations outside of the plan are required.
- Structure may be operated for public relations and/or educational purposes, though output is not to exceed 5000 cfs for a duration of no longer than 2 hours.

DAVIS POND OPERATIONAL PLAN 2015

From December through May, the intent is to operate the diversion to maintain the seasonal average salinity at the 15 ppt line illustrated in the map below. December- May operations will be based on data from the Barataria Bay N Grand Terre gauge specified by the map (Figure 1) and graph below (Figure 2). From June through November, operations will be based on the monthly salinity range at the 5 ppt line specified by the map (Figure 1) and graph (Figure 3) below, utilizing the Barataria Waterway S of Lafitte gauge as the primary gauge. Little Lake Bay Dos Gris will also be monitored, and utilized as a secondary gauge for the 5ppt line. The structure will be operated when the 14-day moving average salinity is within or above the long term data range for the gauge(s) in use. When the moving average drops below the low trigger (the greater of the long term average minus 1SD or 5ppt) the diversion operations will be maintained at the minimum of 1000cfs until the moving average re-enters the operational range. Operational settings are not to exceed 10,000 cfs.

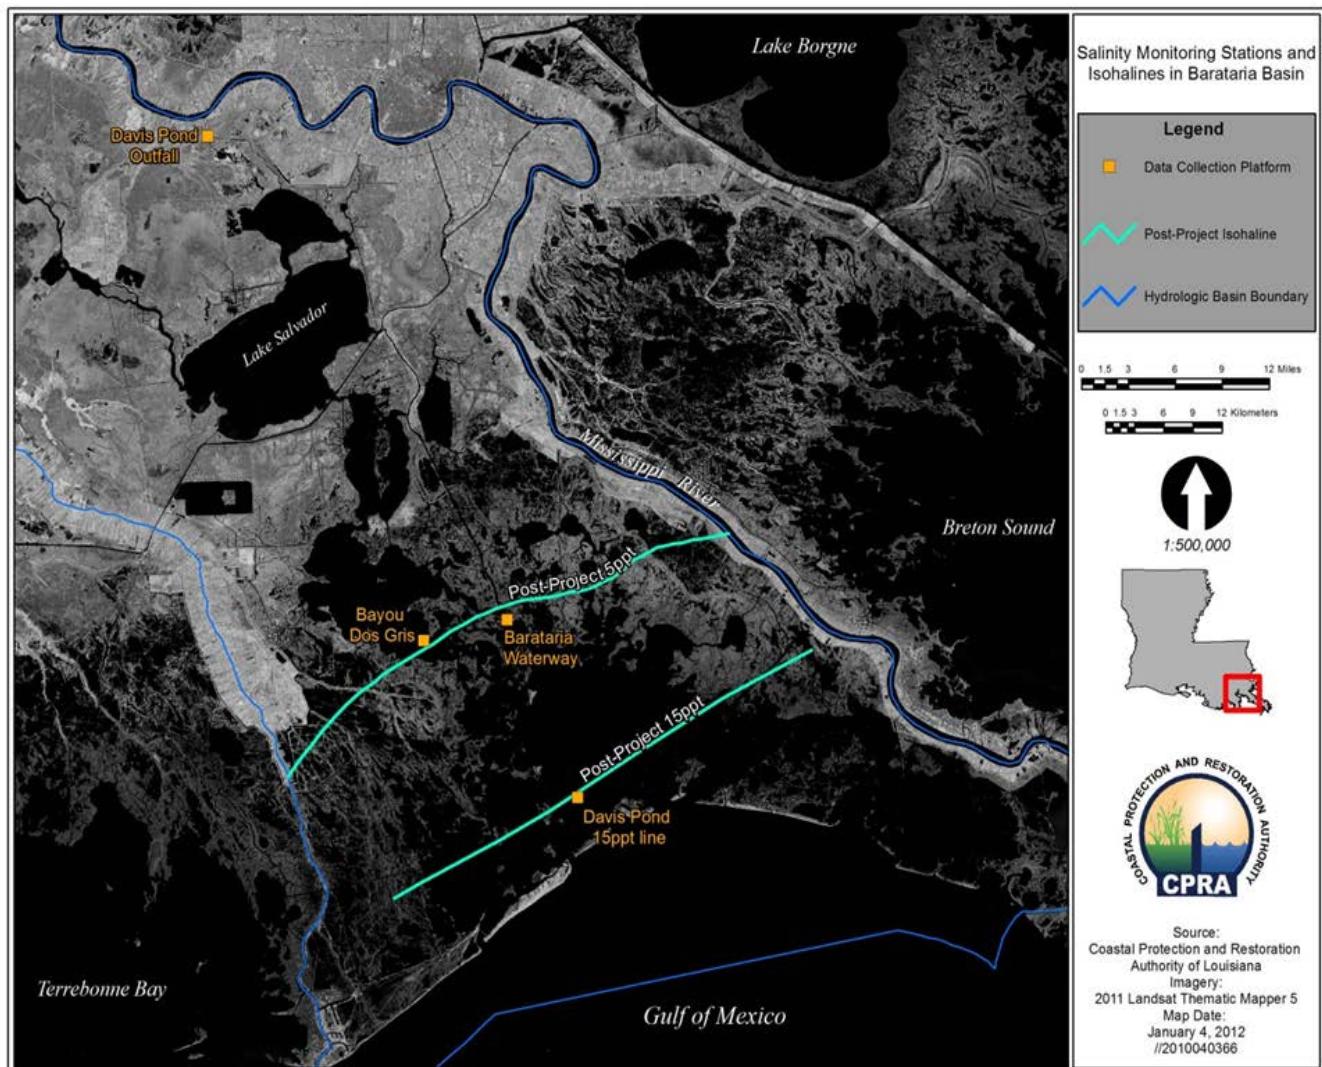

Figure 1. Map of salinity gauges and isohaline lines in Barataria Sound basin to be used for guidance and

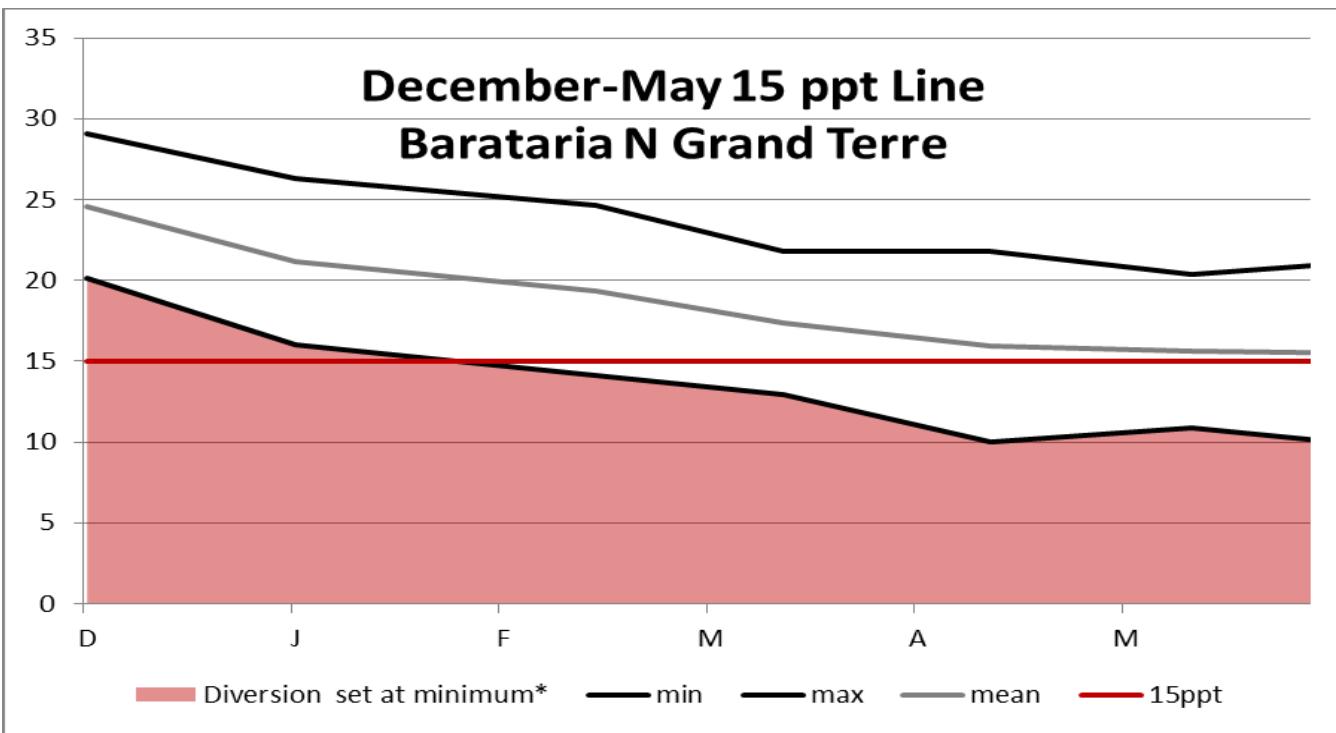

Figure 2. Long term average (\pm 1 standard deviation) salinities from the Barataria Bay N of Grand Terre Gauge (USGS site 291929089562600). From December through May the Davis Pond Freshwater Diversion structure may be operated when the 14-day moving average salinity is within or above the data range. Operations will be decreased to the minimum of 1000cfs if the moving average drops below the low trigger.*

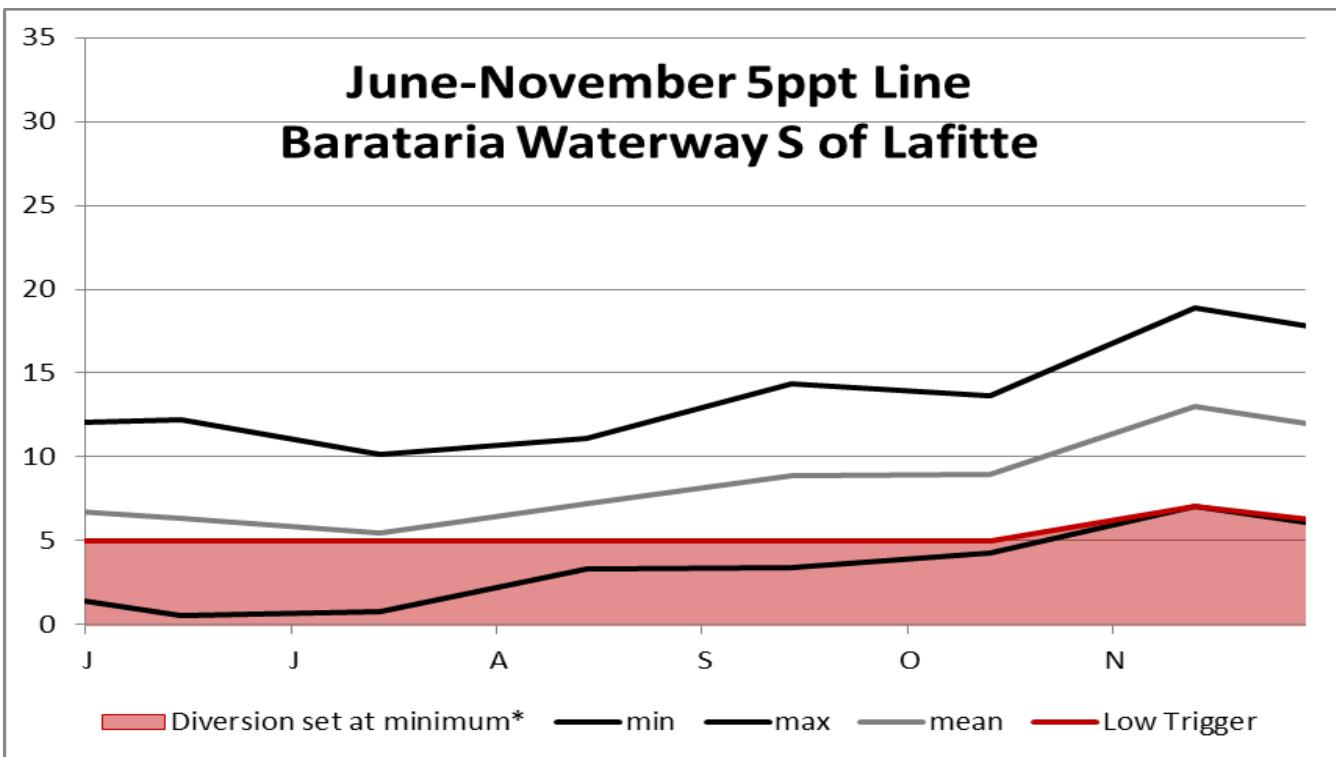

Figure 3. Long term average (\pm 1 standard deviation) salinities from the Barataria Waterway (USGS site 292859090004000). From June through November the Davis Pond Freshwater Diversion structure may be operated when the 14-day moving average salinity is within or above the data range. Operations will be decreased to the 100cfs minimum if the moving average drops below 5ppt.*

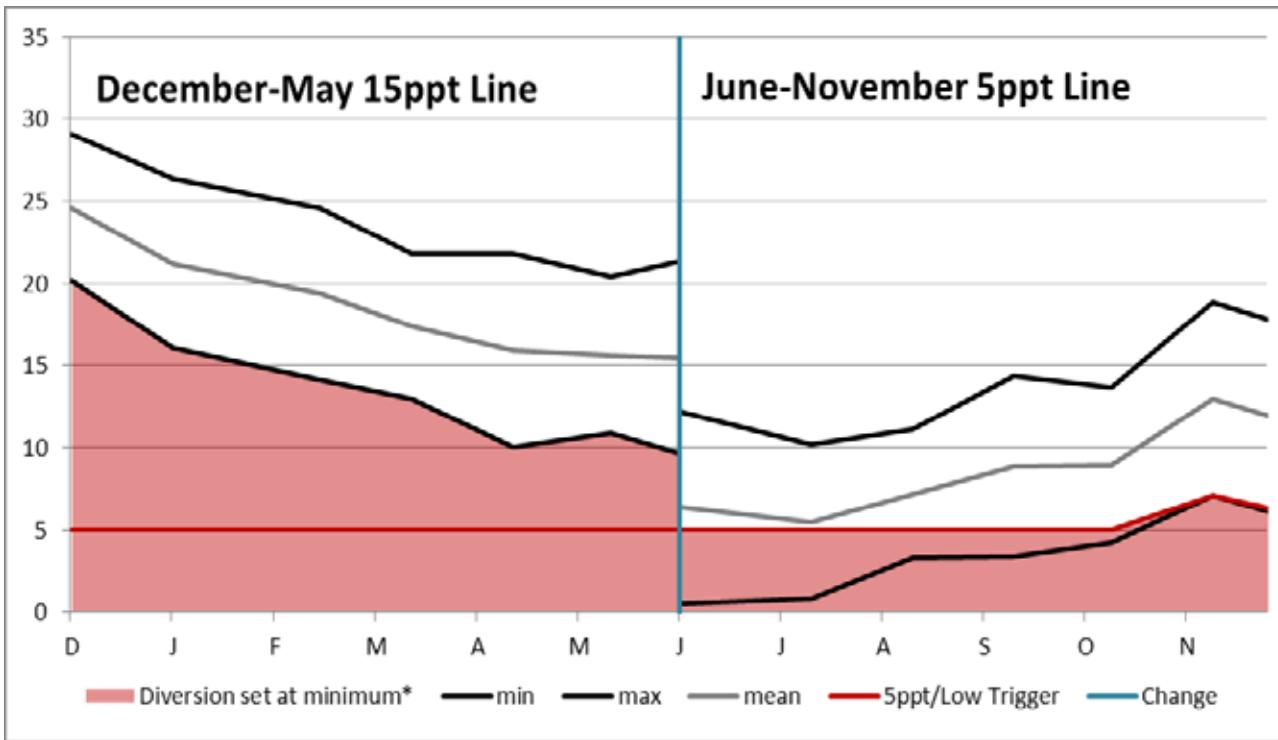

Figure 4. Long term average (+1 standard deviation) salinities from the Barataria Bay N Grand Terre Gauge (USGS site 291929089562600) from December through May, and the Barataria Waterway (USGS site 292859090004000) gauge from June through November. The Davis Pond Freshwater Diversion structure may be operated when the 14-day moving average salinity is within or above the data range. Operations will decrease to the minimum of 1000 cfs if the moving average drops below the low trigger.*

* Discharges may deviate from operational plan as outlined below:

- Emergency, maintenance and local parish situations will be evaluated on a case-by-case basis to determine operational needs. The DPAC shall be notified if operations outside of the plan are required.
- Structure may be operated for public relations and/or educational purposes, though output is not to exceed 5000 cfs for a duration of no longer than 2 hours.

PARISH CIAP PROJECTS

Project Number	Project Name	Project Type	Address/Sponsor	Single District	House District	Parish	Assesment/Sponsor	Coastal Restoration	Areas Benefited	Parties	Funding	Fees/Benefits/Cost	Landowners Costs	Fees/Benefits Costs	Coastal Restoration Costs	Project Summary			Planning Unit
																Start Date	Completion Date	End Date	
BS-17	Lake Lery Rim Re-Creation	MC	BOEMRE/FWS	1	103	S.B.	300	Pending	N/A	\$497,417	\$8,188,293					The project proposes to dredge a waterway through Lake Lery historically used for navigation. The waterway is located approximately along the St. Bernard and Plaquemines Parish line. The project will utilize the dredged material and borrow areas in Lake Lery to create marsh in the open water areas north and east of the lake. It will also re-establish the lake arm by amoring the northern and eastern shoreline of Lake Lery using a rock dike.	1		
PO-39	Bald Cypress/Tupelo Coastal Forest Protection	LA	BOEMRE/FWS	18	88	Liv.	1,762	2011	N/A	\$260,443	\$2,774,290					The project location is within Livingston Parish, in the Maurepas Swamp of southeast Louisiana. The project area includes 2,590.4 contiguous acres of coastal wetland forest, specifically bald cypress-tupelo swamp, with roughly 200 acres fronting the western edge of Lake Maurepas.	1		
PO-40	Hydrologic Restoration in the West Lake Maurepas Swamps	HR	BOEMRE/FWS	18	88	Liv.	6,458	Pending	N/A	\$863,185	\$2,594,680					The Amite River is located southwest of Lake Maurepas and east of I-10. The objective of this project is to allow floodwaters to introduce additional fresh water, nutrients, and sediment into the western Maurepas Swamp. The exchange of flow would occur during flood events on the river and from runoff of localized rainfall events, and would in turn provide nutrients and sediment to facilitate organic sediment deposition in the swamp, some fluctuation of water levels, improve biological productivity, and prevent further swamp deterioration.	1		
PO-41	Update of St. Bernard Parish Coastal Zone Management Plan	PL	BOEMRE/FWS	1	103	S.B.	N/A	N/A	N/A	\$200,000	N/A	Funds will be used so that the St. Bernard Parish Coastal Zone Management Plan may be updated.							1
PO-42	West LaBranche Shoreline Protection	SP	BOEMRE/FWS	19	56	SC.	N/A	Pending	N/A	N/A	\$3,600,000	This project involves the continuation of the rock shoreline protection project on the south shore of Lake Pontchartrain in St. Charles Parish. The project will consist of installing approximately 2,150 linear feet of rock dike on the existing shoreline and the construction of a 130-foot-long timber pile bridge at the mouth of Bayou LaBranche.							1
PO-43	East LaBranche Shoreline Protection	SP	BOEMRE/FWS	19	56	SC.	N/A	Pending	N/A	N/A	\$930,917	This project involves the continuation of rock shoreline protection project on the south shore of Lake Pontchartrain in St. Charles Parish. The project will consist of installing approximately 15,300 linear feet of rock dike.							1
PO-45	East Bank Wastewater Assimilation Plant	MM	BOEMRE/FWS	18	57	S.Ia.	2,400	Pending	N/A	N/A	\$1,600,000	This project will construct a wetland assimilation treatment plan which will collect wastewater from secondary treatment modules in Grand Point, Louisiana. It will pump the wastewater to the pond area that will discharge into seven acres of forested wetland areas that will directly affect 2,400 acres of wetlands.							1
PO-46	Reserve Relieff Canal Shoreline Protection Project	SP	BOEMRE/FWS	19	57	S.Ilo.	N/A	Pending	N/A	\$283,015	\$1,730,042	The proposed project will consist of approximately 1,400 linear feet of shoreline protection extending in an easterly and westerly direction in St. John the Baptist Parish, where the Reserve Relieff Canal enters Lake Maurepas and entrance protection lining. The proposed feature consists of a foreshore rock dike with gaps for fish and public access to the lake shoreline.							1
PO-48	Green Property Preservation Project	LA	BOEMRE/FWS	11	90	S.II.	27	2011	N/A	N/A	\$1,345,000	This project includes the acquisition of a 27.2 acre parcel to preserve a sensitive wetland composed of pristine cypress swamp and bottomland hardwoods from future commercial or residential development. It is located between Bayou LaCombe and the Tammany Trace linear park south of U.S. 190 in LaCombe, Louisiana within the Bayou LaCombe watershed.							1
PO-49	French Property Preservation Project	LA	BOEMRE/FWS	11	90	S.II.	40	2009	N/A	N/A	\$1,718,150	This project includes the acquisition of a 40 acre parcel composed of pine trees and mixed hardwoods with inclusion savannas, which lies between the I-12 Service Road and Bayou Liberty in Slidell, Louisiana. This project is to educate the public about the value of wetlands. Invasive plant species will be removed and nest boxes will be installed.							1
PO-51	Mandeville Aquatic Ecosystem Restoration Project	MM	BOEMRE/FWS	11	89	S.II.	N/A	2010	N/A	N/A	\$3,734,879	This project will include an upgrade of the existing wastewater treatment plant and construction of a discharge structure and piping system for wetland assimilation. It will construct 2.5 miles of force main for disbursement of treated effluent into 1.7 square miles of uninhabited wetland adjacent to the western border of the City of Mandeville.							1
PO-52	Lake Pontchartrain Shoreline Protection	SP	BOEMRE/FWS	6	73	Tang.	N/A	Pending	N/A	\$699,400	\$5,882,716	The project is located in Tangipahoa Parish between Pass Manchac and the mouth of the Tangipahoa River. The goal of this proposed project is to construct approximately 12,000 linear feet of foreshore protection.							1

PARISH CIAP PROJECTS

Program	Project Number	Project Name	Project Type	Agency Sponsor	Senate District	House District	Parish	Access Benefited	Construction Complete Date	Fees/Liability Cost	Erosion/Land Loss Cost	Construction Cost	Project Summary			Planning Unit
													Start Date	Completion Date	Budget	
CIAP	PO-53	Wetland Wastewater Assimilation Process Planning	PL	BOEMRE/FWS	18	58	Sta.	N/A	2009	N/A	\$49,994	N/A	N/A	The study will develop a plan to allow wetland assimilation to provide tertiary treatment to wastewater while improving wetland quality. The study will analyze potential sites and set project goals. The final report will provide preliminary characterizations of the parish's wetland systems, their suitability for wastewater assimilation, an analysis of the wetlands' loading and assimilation capacities, and capabilities of the wetlands and preliminary engineering and cost analyses.	1	
CIAP	PO-70	Northshore Beach Marsh Creation/Restoration	MC	BOEMRE/FWS	11	90	StT.	600	Pending	N/A	\$1,860,558	N/A	N/A	This project is located in the Ponchartrain Basin in St. Tammany Parish. Project features include approximately 600 acres of marsh creation via hydraulic dredging and placement of 2 million cubic yards of material. The likely borrow location is Lake Ponchartrain, the Highway 11 Canal, and Bayou Bonfouca and associated canals. The objectives of this project are to create approximately 600 acres of intermediate marsh, reduce erosion of adjacent interior marshes, and maintain and support the integrity of the Lake Ponchartrain shoreline.	1	
CIAP	PO-71	Waterline Booster Pump Station, East Bank	INF	BOEMRE/FWS	18	58	Sta.	N/A	2011	N/A	\$265,100	\$2,989,653	N/A	The project would construct a waterline booster pump along LA Highway 44 in Convent, Louisiana in St. James Parish. The construction includes housing a 40 hp motor with a 1,100 gallon/minute high-service pump and connecting to the existing 10 inch PVC waterline at two locations in order to establish a loop and by-pass system. The station will have a metal building with a concrete floor to enclose the pump and electrical equipment.	1	
CIAP	BA-50	Bayside Segmented Breakwaters at Grand Isle	SP	BOEMRE/FWS	8	105	Jef.	N/A	2012	N/A	\$307,709	\$2,989,653	N/A	The project is located in Jefferson Parish, Louisiana, along the bay side of Grand Isle, Louisiana. The purpose of this project is to reduce erosion on the bay side of Grand Isle. Twenty-four 300 foot breakwaters (approximately 1.5 miles) will be constructed on the back-bay side of Grand Isle.	2	
CIAP	BA-51	Goose Bayou Ridge Creation and Shoreline Protection	PL	BOEMRE/FWS	8	105	Jef.	1,200	2011	N/A	\$165,935	N/A	N/A	This project located in Lafitte, Jefferson Parish Louisiana, will improve shoreline protection by creating over 8,000 linear feet of additional shoreline through the use sediment from the Mississippi River, and vegetative planting, along the west side of Goose Bayou. This project will help establish a wetland ridge which will function as habitat for native species of plants and animals.	2	
CIAP	BA-52	Lower Lafitte Shoreline Stabilization at Bayou Rigolettes	SP	BOEMRE/FWS	8	105	Jef.	N/A	Pending	N/A	\$387,986	\$7,642,385	N/A	This project located within Lafitte, Louisiana will help protect the integrity of wetlands within the Barataria Basin and reduce saltwater intrusion and deterioration of interior marsh. Over 10,600 linear feet of foreshore rock revetment will be constructed, along with a water control structure in order to protect the interior marshes.	2	
CIAP	BA-53	Maritime Forest Ridge Restoration	VP	BOEMRE/FWS	20	54	Laf.	60	N/A	N/A	\$700,000	N/A	N/A	Distributary ridges and chenier ridges along the coast of Louisiana are disappearing at an alarming rate. Projects such as these help establish ridge habitats and associated wetlands which are extremely important for millions of migrating Neotropical songbirds that cross the Gulf of Mexico, in addition to providing wetland habitat for coastal plant and animal species.	2	
CIAP	BA-54	Northwest Little Lake Marsh Creation and Enhancement	DM MC VP	BOEMRE/FWS	20	54	Laf.	100	2011	N/A	\$222,430	\$2,209,910	N/A	This project, located in Lafourche Parish, will use dedicated dredge material to create 30-40 acres of wetlands in interior open water bodies (enhancing ~70-100 acres of marsh) and plant 2 rows of smooth cordgrass along approx. 7,500 linear feet of the lake shoreline.	2	
CIAP	BA-56	Update of the Plaquemines Parish Coastal Management Plan	PL	BOEMRE/FWS	1	105	Plaq.	N/A	N/A	N/A	\$300,000	N/A	N/A	Funds will be allocated to the Parish so that they may update their coastal management plan.	2	
CIAP	BA-57	Tidewater Road Flood Protection	INF	BOEMRE/FWS	1	105	Plaq.	N/A	2010	N/A	\$3,364,310			Tidewater Road is subject to heavy inundation from directional winds that elevate tides over the roadway. Wetland loss in the area is severe, and along much of Tidewater Road's length there is open water in canals and ponds that about the road shoulder. Tidewater Road is an important access point for the oil and gas industry. This project also proposes to create flood protection along the entire length of Tidewater Road.	2	

PARISH CIAP PROJECTS

Program	Project Number	Project Name	Project Type	Agency/Sponsor	Senate District	House District	Parish	Ag's Benefited	Conservation Dates	Floodability Dates	Engineering Design Co.	Construction Co.	Project Summary			Planning Unit	
													Start Date	Completion Date	Budget		
CIAP	BA-59	Waterline Booster Pump Station, West Bank	INF	BOEMRE/FWS	18	58	Sta.	N/A	2009	N/A	N/A	N/A	\$256,700				This project would construct a waterline booster pump station in Welcome, Louisiana. The proposed site is located near Section 43, T-11-S, R-3-E, along LA Highway 18. The proposed construction includes the installation of a 40 hp electric motor with a 1,100 gpm high-service pump. The booster pump will be built along the existing waterline and be tied in at two places in order to establish a loop and by-pass system with 10-inch in-line valves. The station will have a metal building with a concrete floor to fully enclose and protect the pump and electrical equipment.
CIAP	BA-61	West Bank Wetland Conservation and Protection	LA	BOEMRE/FWS	18	58	Sta.	235	2010	N/A	N/A	N/A	\$718,620				The St. James Parish Council would like to purchase several large tracts of existing wetlands to prohibit the destruction of, and aid in the protection of, the parish's coastal wetland areas. This project proposes to purchase approximately 235 acres of existing wetlands from the Bayou Chevreuil Land Co., LLC.
CIAP	BA-62	West Bank Wastewater Assimilation Plant	MM	BOEMRE/FWS	18	58	Sta.	2,400	Pending	N/A	N/A	N/A	\$1,757,026				The St. James Parish Council plans to construct a wetland assimilation treatment plant on property owned by the Parish Council in Vacherie, Louisiana. The plant will collect wastewater from secondary treatment modules and pump the wastewater to a sediment pond area. The nine acre pond will discharge into 2,400 acres of forested wetland areas that will directly affect the swamp's composition and structure.
CIAP	BA-63	Small Dredge Program	DM MC	BOEMRE/FWS	20	54	Laf.	175	2010	N/A	N/A	\$160,250	\$2,789,031				This program involves the use of a small dredge to hydraulically dredge borrow canals and other open water areas to restore approximately 175 acres of marsh apportion along levees, caniers and roadways in Lafourche Parish.
CIAP	BA-64	Jump Basin Dredging and Marsh Creation	MC	BOEMRE/FWS	1	105	Plaq.	7	Pending	N/A	N/A	N/A	\$800,000				The proposed project is located in the Venice area of Plaquemines Parish, and more specifically in the Jump Basin Marina and along the west side of Tidewater Road. The proposed project would use material dredged from the marina to create marsh on the west side of Tidewater Road. Based on preliminary surveys, it is predicted that approximately 65,000 cubic yards of material could be dredged from the marina. Based on water depths in the target area, an initial estimate of 4 to 7 acres of marsh could be created.
CIAP	BA-65	Fifi Island Restoration Extension	BI	BOEMRE/FWS	8	105	Jef.	6	Pending	N/A	N/A	\$208,251	\$2,338,605				The project is located at the eastern tip of Fifi Island, adjacent to Bayou Rigaud, on the northern side of Grand Isle. The project would provide approximately 2,200 linear feet of rock-dike protection and create approximately 6 acres of marsh. Additionally, the project will provide protection to the bay side of Grand Isle.
CIAP	NA	Culvert Installation Through Existing Berms and Board Roads	LA	BOEMRE/FWS	18	58	Sta.	N/A	Pending	N/A	N/A	N/A	\$90,686				The St. James Parish Council will install 24 inch plastic pipe through existing spoil banks and earthen berms to allow water exchange through these man-made barriers. The culvert installations will allow present ingress and egress into these areas to continue and enhance the water quality and nutrient exchange in the project area. It is estimated that approximately 100 sites would each need three sets of culverts to be installed along this 20 mile stretch of canal.
CIAP	PO-90	West Lac Des Allemands Shoreline Protection	SP	BOEMRE/FWS	18	58	Sta.	N/A	Pending	N/A	N/A	\$507,369	\$3,313,183				The proposed project will consist of 7,535 feet of shoreline protection, extending from "Pleasure Bend" westward to Pointe Aux Herbes, along the western shore of Lac des Allemands, St. John the Baptist Parish, Louisiana. The proposed feature consists of foreshore rock dike with gaps for fish and public access to the lake shoreline.
CIAP	CS-36	Shoreline Protection at Intracoastal Park	SP	BOEMRE/FWS	27	36	Cal.	3	Pending	N/A	N/A	N/A	\$1,000,000				This is a two phase project that is located on the south side of the Gulf Intracoastal Waterway at LA Highway 27 south. The goal of the project is to restore the existing rock shoreline protection and stabilization for approximately 1,000 feet by placing cellular concrete block revetment along the existing shoreline.
CIAP	CS-37	South GIWW Restoration	HR SP	BOEMRE/FWS	30	36	Cal.	2,500	Pending	N/A	N/A	\$83,074	\$525,459				This project features include the relocation of two existing water control structures (48 inch culverts) that are currently not functioning as designed; the installation of a new water control structure (two 36 inch culverts); and the refurbishment of three miles of adjacent levees.

PARISH CIAP PROJECTS

Project Number	Project Name	Project Type	Agency Sponsor	Source District	Districts Benefited	Construction Dates	Fees/Benefits Cost	Land/Debris Cost	Engineering Costs	Project Summary				Planning Unit
										Start Date	End Date	Cost	Comments	
CIAP ME-30	North Mermantau Restoration	HR MM	BOEMRE/FWS	25	47	Cam.	\$211,141	\$3,006,631	N/A	10,000	2011	N/A	This project will replace 1.2 existing water control structures that are not currently functioning as designed and also refurbish 1.5 miles of adjacent levees. Cameron Parish will purchase the structures that will be installed by the local gravity drainage district. The objective is to restore the pre-Hurricane Rita salinity and water levels to approximately 10,000 acres of marsh.	4
CIAP NA	Calcasieu Parish Administrative Assistance	PL	BOEMRE/FWS	27	36	Cal.	N/A	N/A	N/A	\$20,000	N/A	N/A	This project will provide necessary financial assistance to Calcasieu Parish Government to manage and implement the CIAP program.	4
CIAP TE-59	Attakapas Canal Hydrologic Restoration	DM HR	BOEMRE/FWS	21	60	Asu.	N/A	\$48,000	\$977,000	12	Pending	N/A	This project will remove excessive accumulated sediment from Attakapas Canal at its intersection with Lake Verret in Assumption Parish for a distance of approximately 2,000 feet improving water quality, fisheries habitat, and sport fishing access. The removed sediment will be beneficially used to restore approximately 12 acres of bald cypress habitat along the shoreline of Lake Verret. As part of the project, cypress trees will be planted at the rate of 302 trees per restored acre.	3a
CIAP TE-60	Lake Verret Swamp and Lake Rim Restoration	DM MC	BOEMRE/FWS	21	60	Asu.	N/A	\$115,000	\$4,634,146	40	Pending	N/A	Located in west-central Assumption Parish, Lake Verret accumulates sediment in its shallow areas. The proposed project will use a hydraulic dredge to remove accumulated sediment from Lake Verret and improve the condition of 40 acres of deteriorating lake rim and adjacent swamp habitat.	3a
CIAP AT-06	Point Chevreuil Shoreline Protection	MC SP	BOEMRE/FWS	21	50	StM.	N/A	\$204,461	\$1,655,704	25	Pending	N/A	The project is located in Region 3, Atchafalaya River Basin, St. Mary Parish, along the southeastern shoreline of East Cote Blanche Bay, around Point Chevreuil and the northwestern shoreline of Atchafalaya Bay. The eroding shoreline was caused by the open water fetch and resulting wave energy from East Cote Blanche and Atchafalaya Bays. Project features will protect the natural ridge functions of the Bayou Sale Ridge and protect the adjacent marshes.	3b
CIAP AT-07	Deer Island Pass Realignment	DM HR MC	BOEMRE/FWS	21	51	StM.	50	N/A	\$2,440,352	5	Pending	N/A	Located in St. Mary Parish, this project near the mouth of Deer Island Bayou will dredge a 5,280 foot long, 28 foot wide channel to improve water and sediment flow into northeast Atchafalaya Bay. The dredged material will be beneficially used to reduce shoreline erosion and to create about 30 acres of marsh.	3b
CIAP AT-08	Bayou Amy Boat Launch and Educational Pavilion	PA	BOEMRE/FWS	22	46	StMt.	N/A	\$47,950	\$3,42,050	N/A	Pending	N/A	This project located in St. Martin Parish will construct an open-air pavilion and a 1,235 foot long nature trail adjacent to an existing wilderness canoe trail. This project will serve as a gateway to the Atchafalaya Basin providing public access, information and educational opportunities. It will ultimately tie into Lake Fausse Point State Park.	3b
CIAP AT-09	Stephensville Wastewater Assimilation and Facility Restoration	MM	BOEMRE/FWS	21	50	StMt.	5	N/A	\$2,200,002	N/A	Pending	N/A	This project will include an upgrade of the existing wastewater treatment plant infrastructure and construction of a discharge structure and piping system into the adjacent wetlands for wetland assimilation. Stephensville's wastewater facility is located in Stephensville along Bayou Milhonnie in Lower St. Martin Parish.	3b
CIAP AT-10	Beau Bayou Water Quality and Sediment Reduction	HR SNT	BOEMRE/FWS	22	46	StMt.	23,000	\$340,960	\$3,360,461	N/A	Pending	N/A	This project consists of a combination of multiple actions including dredging, gapping and creating in-line-sediment traps in and adjacent to Beau Bayou in St. Martin Parish. This will correct existing sediment overload and lack of oxygen (hypoxia) improving fisheries habitat as well as the overall health of the system.	3b
CIAP TV-24	Weeks Bay/Commercial Canal Marsh Creation and Shoreline Protection	PL	BOEMRE/FWS	22	49	Ile. Ver.	N/A	\$200,000	N/A	N/A	N/A	N/A	Feasibility Study of methods of marsh creation to build landmass and create vegetated wetlands. Project will evaluate various methods to create a sediment deposition field and protect the existing shoreline. This will enhance natural processes to create landmass between Weeks Bay and the GIWW and protect it.	3b
CIAP TV-25	Port of Iberia Bridge Replacement - Port Road over Roderie Lateral	INF	BOEMRE/FWS	22	49	Ile.	N/A	\$66,465	\$391,807	2012	N/A	N/A	The project is located in Iberia Parish, and will aid the Port of Iberia in its day-to-day operations. This project will replace the bridge on Port Road over Roderie Lateral. The existing bridge is approximately 28 feet wide and 60 feet long. The Port of Iberia handles a substantial amount of OCS produced products and the large equipment used in transporting these products take a major toll on the port's bridges and roadways.	3b

PARISH CIAP PROJECTS

Program	State Project Number	Project Name	Project Type	Agency/Sponsor	Senate District	House District	Parish	Access Benefited	Construction Complete Date	Funding Capacity Cost	Emergency Design Cost	Emergency Design Cost	Construction Cost	Project Summary	Planning Unit	
TV-32	Lake Sand Terracing	MC SP VP	BOEMRE/ FWS	22	49	Ibe.	\$5	2013	N/A	\$66,500	\$1,094,130	\$645,554	\$4,662,196	The project is located in Iberia Parish on the Marsh Island State Wildlife Refuge, and will construct approximately .55 acres of shallow bay bottom terraces planted with native vegetation. The construction of the terraces will result in the direct creation of .34 acres of marsh and it is anticipated that construction of the terraces will result in a 50% reduction in the erosion of the neighboring shoreline.	3b	
TV-33	Lake Tom Terracing	MC SP VP	BOEMRE/ FWS	22	49	Ibe.	\$5	2013	N/A	\$66,500	\$1,094,130	\$645,554	\$4,662,196	The project is located along the Vermilion Bay Shoreline south of Tigre Lagoon, it will establish approx. 8,300 linear feet of shoreline using the wave dampening structure determined to be most feasible. These structures will also allow for sediment trapping and accretion.	3b	
TV-35	Vermilion Bay Shoreline Restoration	SP VP	BOEMRE/ FWS	22	49	Ibe.	132	2012	N/A	\$330,000	\$1,010,000	N/A	N/A	This project will provide necessary financial assistance to St. Mary Parish Government to manage and implement the CIAP program.	3b	
TV-36	Planning Assistance and Administration (St. Mary Parish)	PL	BOEMRE/ FWS	21	50	Sim.	N/A	N/A	N/A	\$25,000	\$1,010,000	N/A	N/A	This project in St. Mary Parish at the Burns Point Recreation Park adjacent to East Cote Blanche Bay, will provide a 600 foot sheet bulkhead and walkway along the park's shoreline. This will stop the rapid erosion that is occurring at the park's shoreline and provide access for inspection.	3b	
TV-37	Burns Point Recreation Park Improvements	SP	BOEMRE/ FWS	21	50	Sim.	N/A	2011	N/A	N/A	\$1,010,000	N/A	N/A	N/A	Funds will be available to assist Vermilion Parish in improvements to the Coastal Zone Management plan for the parish.	3b
TV-38	Thorgerson Road Improvements	INF	BOEMRE/ FWS	21	50	Sim.	N/A	2012	N/A	\$134,000	\$1,018,761	N/A	N/A	The project is located in Berwick and extends to Morgan City in St. Mary Parish. This project will upgrade Thorgerson Road from Hwy 90 to the River Road, as a result it, the project will increase capacity, and improve safety and efficiency during normal operations. The road improvement feature includes the widening of the existing road. The preliminary project benefit is to provide improved traffic flow and safety while increasing roadway access to the industrial and commercial facilities located in Berwick, Louisiana.	3b	
TV-40	Vermilion Parish CZM Planning and Development	PL	BOEMRE/ FWS	26	47	Ver.	N/A	N/A	N/A	\$100,000	\$1,018,761	N/A	N/A	Funds will be available to assist Vermilion Parish in improvements to the Coastal Zone Management plan for the parish.	3b	
TV-41	Shoreline Protection on Southwest Point at Southwest Pass	PL	BOEMRE/ FWS	26	47	Ver.	N/A	N/A	N/A	\$217,782	\$1,018,761	N/A	N/A	This project is located in Vermilion Parish. The goal of the project is to armor the shoreline via 8,759 linear feet of onshore revetment for the south shoreline of Vermilion Bay at Southwest Point. The funds allocated in the current project would be used to initiate surveying, geotechnical investigation, engineering, design and permit development so that when additional funds become available this project will be able to proceed to construction in a more-timely manner.	3b	
TV-44	Henry Hub Access Improvements - Highway 331 Realignment	INF	BOEMRE/ FWS	26	49	Ver.	N/A	Pending	N/A	\$39,500	\$272,299	\$272,299	\$272,299	This project will realign approximately 2,000 linear feet of LA Hwy. 331, at a location approximately 3 miles south of LA Hwy.14. This segment of the roadway has a reverse curve that represents a safety hazard for traffic traveling this highway to the Henry Hub.	3b	
TV-45	Shoreline Protection and Marsh Creation at Tiger Point	SP	BOEMRE/ FWS	26	47	Ver.	N/A	Pending	N/A	\$186,455	\$1,199,130	\$1,199,130	\$1,199,130	This project will install 1,500 feet of cement bags at Tiger Point in Vermilion Parish to slow erosion rates by half.	3b	
TV-46	Henry Hub Access Improvements - Charlie Field Road Bridge Replacement	INF	BOEMRE/ FWS	26	49	Ver.	N/A	2011	N/A	\$67,000	\$371,201	\$371,201	\$371,201	This project will replace an existing three span timber bridge with a four span concrete deck bridge for the Charlie Field Road across a tributary of Bayou Tigre. The bridge is located approximately 2,300 feet south of LA Hwy. 14, in eastern Vermilion Parish.	3b	
TV-49	Intracoastal City Street Improvements	INF	BOEMRE/ FWS	26	47	Ver.	N/A	2011	N/A	\$51,400	\$469,416	\$469,416	\$469,416	This project provides for the reconstruction of several roadways in the Intracoastal City area to mitigate the damage caused by heavy oilfield support truck traffic over the years. The streets to be improved are as follows: Offshore Road (4,700 linear feet), M. I. Liquid Road (850 linear feet), Barge Road (1,450 linear feet), Teal Road (1,200 linear feet).	3b

CIAP	TV-50	Henry Hub Access Improvements - Charlie Field Road	INF	BOEMRE/FWS	26	49	Ver.	N/A	2012	N/A	\$87,270	\$42,000	This project provides for the widening and reconstruction of Charlie Field Road, a vital link between LA 14 and the Henry Hub, from LA Hwy. 14 to LA Hwy. 331 in eastern Vermilion Parish. The project will widen the existing 18-foot wide roadway to a 20-foot surface for approximately 4,000 feet to provide room for the truck traffic to utilize this stretch of the roadway to access the Henry Hub.		3b
CIAP	TV-51	Oyster Reef Parallel to Chene au Tigre	SP	BOEMRE/FWS	26	47	Ver.	N/A	Pending	N/A	\$209,800	\$1,229,184	This project will create one mile oyster reef 1,300 feet from shore by using approved, available materials. Oyster spat are plentiful in this area; therefore, creating this base will establish a living sustainable reef. This project will reduce the shoreline loss rate by half. It will slow down wave energy, attract fish and shellfish habitat, slow coastal erosion, and increase recreational fishing opportunities.		3b
CIAP	TV-53	North Prong Schooner Bayou	FD SP	BOEMRE/FWS	26	49	Ver.	N/A	2010	N/A	\$54,277	\$1,595,723	This project is located on the east bank of the North Prong of Schooner Bayou, from the GIWW to the Schooner Bayou Locks. With several breaches to contain, the project will employ culverts with flap gates to allow the freshwater flow to continue into the marshes to the east, while preventing uncontrolled saltwater intrusion into the Mermata Basin.		3b

Program: CIAP= Coastal Impact Assistance Program

Project Type: BI=Barrier Island; DM=Beneficial Use of Dredged Material; FD=Freshwater Diversion; HP=Hurricane Protection; HR=Hydrologic Restoration; INF=Infrastructure; LA=Land Acquisition; MC=Marsh Creation; MM=Marsh Management; OM=Outfall Management; PA=Public Access; PL=Planning; SD=Sediment Diversion; SNT=Sediment and Nutrient Trapping; SP=Shoreline Protection; VP=Vegetation Planting.

Agency/Spouse: BOEMRE= Bureau of Ocean Energy Management, Regulation, and Enforcement; FWS= US Fish and Wildlife Service. The administration of CIAP was transferred from BOEMRE to FWS on Oct. 1, 2011.

Parish: Asc=Ascension, Ass=Assumption, Cal=Calcasieu, Cam=Cameron, Ibe=Iberia, Jeff=Jefferson, Laf=Lafourche, Liv=Livingson, Or=Orleans, StC=St. Charles, Sta=St. James, StJ=St. John the Baptist, StM=St. Mary, StMt=St. Martin, StT=St.Tammany, Tan=Tangipahoa, Ter=Terrebonne, Plaq=Plaquemines, Ver=Vermilion

N/A	Orleans Landbridge	SP	1	103	StB.	Not provided	Orleans Landbridge shoreline protection.		1
N/A	St. Bernard Parish	OR	1	103	StB.	Not provided	Develop Oyster reefs as shoreline barrier-Biloxi Marsh.		1
NA-9	Bayou Dupont Sediment Delivery Expansion	MC	8	105	Jef	\$25,000,000	This project would supplement a sediment delivery project now being developed by extending the sediment deposition areas to the north (Phase I) and south (Phase II) to restore these wetlands and enhance Land Bridge integrity. Phase I would restore the bounding shorelines and restore approximately 1,800 acres of wetlands. Phase II would restore approximately 2,000 acres of wetlands.	2	
PR-1	Bayou Rigolettes, Bayou Perot, and Harvey Cut Channel Management	HR	8	105	Jef	\$2,770,000	This project would restore hydrologic conditions at the critical Land Bridge area by plugging several oil and gas canals, restricting channel dimensions at Harvey Cut, and restricting channel dimensions at the Bayou Perot/ Little Lake intersection.	2	
MG-3	Dupre Cut Project (BA-26) Wetland Restoration	MC	8	105	Jef	\$45,880,000	The project includes the development of an area-wide sediment delivery system. This system would utilize existing rock dikes at Dupre Cut as a retention feature to ensure that the sediments are successfully distributed into the target areas.	2	

PROJECT CONCEPTS FROM COASTAL PARISH MASTER PLANS

Program	Local Project Number	Project Name	Project Type	State District	House District	Project Costs	Project Summary		Planning Unit
							Description	Impact	
CWPRA	MG-5	South Shore of The Pen Shoreline Protection/ Stabilization	MC, SP	8	105	Jef.	\$34,800,000	The project would be conducted in three phases. Phase I would involve placing a dedicated dredge in the Barataria Bay Waterway that would retrieve sediments from the bottom of the waterway and place them behind the existing rock armor along the eastern shore. Phase II would include constructing a rock dike along the southeastern shoreline of The Pen and using a dedicated dredge to place materials behind it. Phase III would consist of reinforcing the existing protection along the southwestern shore of The Pen and filling the area behind the protection with dredged material.	2
CWPRA	PR-2	Dupre Cut Barataria Bay Waterway Channel Management	HR	8	105	Jef.	\$7,600,000	This project proposes to strategically place four sheetpile barriers in the Barataria Bay Waterway as a means of reestablishing historic levels of hydrologic exchange within the area. This project would help protect the integrity of the shorelines of the Dupre Cut portion of the Barataria Bay Waterway. The project would also restrict channel dimensions to limit saltwater intrusion, tidal prism, and enhance freshwater retention.	2
CWPRA	BS-1	PPL 3 (XBA-1c) Grand Pierre Island Restoration	SP	8	105	Jef.	N/A	The project would reconstruct breached shorelines, then restore interior marsh elevations and sand dune features.	2
CWPRA	PR-7	Land Bridge Shoreline Protection Extension and Wetland Restoration	MC, SP	8	105	Jef.	\$39,000,000	This project is designed to fortify the region on the southern side of a portion of the Land Bridge Project - Phase 3. The wetland area is being hydrologically degraded by interior exposure from the oilfield canal breaches and shoreline erosion along surrounding water bodies. The project would construct approximately 28,000 feet of shoreline protection interspersed with viable oilfield canal closures, followed by the placement of dedicated dredge material to restore elevations of degraded wetland areas. The final identification of viable canal closure and wetland fill targets would be established during project design to maximize project effectiveness and minimize oil and gas impacts.	2
CWPRA	NA-3	Goose Bayou to Cypress Bayou Shoreline Protection	SP	8	105	Jef.	\$5,000,000 - \$25,000,000	Approximately 8,000 linear feet of additional shoreline protection would be added along the west side of Goose Bayou to its intersection with Cypress Bayou. A dedicated dredge would move sediment from the bottom of The Pen to the area behind the shoreline protection. The deposited material would be built into a topographic ridge to restore the historic function of ridges in the project area. The artificial ridge would be planted with woody vegetation.	2
CWPRA	BI-4	Elmer's Island and West Grand Terre Oak Ridge Restoration	BI	8	105	Jef.	\$3,000,000	This project will restore the natural ridges that historically sustained the growth of Oak Trees. The restored ridges would then be vegetated.	2
CWPRA	FN-1	Caminada Chenier Restoration	BI	8	105	Jef.	\$19,000,000	This project will restore the areas natural chenier plain morphology by restoring the elevation and integrity of approximately seven deteriorated ridges. Existing ridges would be followed and breaches would be plugged to interconnect remaining ridge features. The project would also provide for the restoration of former borrow pits along LA Highway 1. Restoration of the former borrow pits would include the degradation of pit levees, followed by the placement of fill. Future dedicated dredging projects could be initiated for the purpose of restoring basin areas between the restored ridges to restore natural elevation and hydrologic gradients.	2
CWPRA	MG-1	Myrtle Grove Natural Ridge Restoration	RR	8	105	Jef.	\$6,230,000	This project will restore the natural ridges that historically sustained the area's complex hydrology. Existing bankings will be followed and breaches will be plugged to interconnect existing land masses, and would thus create a series of ridges. The northern ridge would be constructed along a portion of the north bank of Bayou Dupont that lies between its intersection with oil and gas canals in the Sea Deuce area, westward from the intersection with the southeast bank of Chenier Traverse Bayou. The southern ridge would be constructed from the intersection of the Barataria Bay Waterway with the historical Bayou Barataria ridge, north of Dupre Cut, and would then veer southeastward, along the north bank of the historical ridge, crossing the Texaco Canals, and then intersecting with the north bank of Bayou Maurice, to terminate at the west bank of the Barataria Bay Waterway.	2
CLAP	MG-2	Lafitte Oil and Gas Field (East) Restoration	HR	8	105	Jef.	\$2,230,000	This project is to restore natural hydrology by eliminating avenues for saltwater intrusion and sediment loss. The Texaco Canals are a maze of existing oil and gas canals which now breach the natural ridges. After an evaluation of production activities within the field, several canals will be eliminated and plugged off to re-connect existing land masses. Future dedicated dredging can be utilized to fill the abandoned canals to reduce saltwater intrusion and enhance freshwater and sediment retention.	2
CLAP	PR-5	Shoreline Stabilization at North Bank of Bayou Rigolettes near Bayou Barataria	SP	8	105	Jef.	\$1,040,000	This project would protect the integrity of the north shoreline of Bayou Rigolettes at its intersection with Bayou Barataria near Lafitte, and would provide protection for the foundation and site of an existing water tank facility that provides potable drinking water to the coastal community of Grand Isle. The project would also eliminate further erosion of the north bank of Bayou Rigolettes directly at its intersection with Bayou Barataria, and by restricting any further widening of the channel, would help to limit unrestricted tidal prism exchange and saltwater intrusion.	2
CLAP	PR-6	Delta Farms Oil and Gas Field Restoration	SP	8	105	Jef.	\$1,300,000	This project would plug redundant oilfield access canals to enhance freshwater retention, improve hydrology, and to reduce pathways for saltwater intrusion and extreme tidal exchange.	2

PROJECT CONCEPTS FROM COASTAL PARISH MASTER PLANS

Program	Project Number	Project Name	Project Type	State and Local	House District	Parish	Project Summary			Planning Unit
							Start Date	End Date	Cost	
CIAFP	BI-5	Grand Isle Oil and Gas Pipeline Corridor Shoreline Protection - Alternative 1	SP	8	105	Jef.	\$2,400,000	The project is designed to protect Grand Isle's southern shoreline from erosion which may eventually affect the integrity of an offshore pipeline corridor. This alternative would construct a rock dike along an approximately 2-mile section of Grand Isle shoreline to directly protect the beach by armament.	2	
CIAFP	BI-5	Grand Isle Oil and Gas Pipeline Corridor Shoreline Protection - Alternative 2	SP	8	105	Jef.	\$1,600,000	The project is designed to protect Grand Isle's southern shoreline from erosion which may eventually affect the integrity of an offshore pipeline corridor. This alternative would construct approximately 1.25 miles of rip-rap breakwater segments to extend an existing breakwater alignment eastward. This would indirectly protect the beach by reducing wave energy.	2	
LAF-3	Leeville Bridge Preliminary Design	INF	8	105	Jef.	\$1,750,000	This project would complete the preliminary design for the construction of a replacement for the Leeville Bridge. The preliminary design phase would include survey, geotechnical testing, mitigation, permits, and the preparation of a preliminary design.		2	
PR-11	Bayou Perot/Riglettes Peninsula Restoration	MC, SP	8	105	Jef.	\$125,000,000	The project would construct approximately 22,000 feet of restored shoreline to reconnect remaining landmasses of the peninsula. Dedicated dredge material would then be placed to fill open water areas, then to restore overall wetland elevations. The sequencing and limits for the filling of target areas would be established during project design to maximize effectiveness.		2	
NA-8	Goose Bayou to Lafitte Levee	HP	8	105	Jef.	N/A	This project would construct flood protection from the Town of Jean Lafitte southward to Goose Bayou. The flood protection system would be constructed east of LA Highway 45 at the wetland/non-wetland interface.		2	
BI-3	Elmer's Island Acquisition and Preservation	LA	8	105	Jef.	\$6,000,000	This project recommends the public purchase and preservation of 1,700 acres of Elmer's Island as a publicly accessible primitive area.		2	
CS-4	Wetland Harbor Activities Recreational Facility (WHARF)	LA	8	105	Jef.	\$28,000,000	The project involves the development of multi-use facilities to provide individuals of all physical capabilities with onsite recreational opportunities. The development will also afford them access to the adjacent wetlands, nearby State and Federal parks, and the abundant natural and cultural experiences offered by Louisiana's wetlands.		2	
BB-1	North Barataria Bay Shoreline Wave Breaks	SP	8	105	Jef.	\$42,600,000	This project would provide basin-wide protection to insure the integrity of the affected wetland shorelines, south of Bay Jimmy and Wilkerson Bayou in the eastern portion of the project, north of Barataria Bay in the middle portion of the project, and adjacent to Bayou Cholas, Bayou Dafond, and Creole Bay in the western portion of the project. The project would restrict channel dimensions at various locations in order to limit saltwater intrusion, tidal prism, and enhance freshwater retention.		2	
NA-1	Naomi Siphon Sediment Enrichment	FD	8	105	Jef.	\$330,000	This project involves using a dedicated dredge during high water levels in the river, to pump river-bottom sediment into the discharge stream of the siphon. The enriched effluent would continue its course over land, depositing the sediments along its route.		2	
NA-6	Rosethorne Wetlands Sewage Effluent Diversion	WA	8	105	Jef.	\$80,000	The proposed project envisions re-routing the Rosethorne wastewater treatment plant effluent from the Intracoastal Canal to an area of adjacent wetlands. The project would consist of upgrading the capacity of the existing sewerage effluent pumping station and installing approximately 1,300 feet of force main. Water control structures and a flow distribution system would also be constructed to channel the flow through the wetlands. The outlet of the discharge line would be placed at the most hydrologically upstream point of the target wetland feasible to ensure that the maximum area of wetlands is benefited and the highest contaminant removal possible is achieved.		2	
CS-3	Bayou Segnette Wetlands Sewage Effluent Diversion	WA	8	105	Jef.	\$350,000	The proposed project envisions re-routing the Westwego wastewater treatment plant effluent from the local drainage canal network to an area of adjacent wetlands. The project would consist of constructing an effluent pumping station and installing approximately 4,200 feet of force main. Water control structures and a flow distribution system would also be constructed to channel the flow through the wetlands. The outlet of the discharge line would be placed at the most hydrologically upstream point of the target wetland feasible to ensure that the maximum area of wetlands is benefitted and the highest contaminant removal possible is achieved.		2	
BI-6	Grand Isle Plan Part I - NW Grand Isle Breakwater Enhancement	SP	8	105	Jef.	\$650,000	This project will modify existing ineffective breakwater segments on the northwest side of Grand Isle to close gaps which prevent sediment accretion.		2	
N/A	Bay Coquett Barrier Island	BI	1	105	Plaq.	Not provided	Barrier Island Fronting Bay Coquette east of Scofield Island.		2	
N/A	Chaland Headland	BI	1	105	Plaq.	Not provided	Chaland Headland.		2	
N/A	Cheniere Ronquille	BI	1	105	Plaq.	Not provided	Cheniere Ronquille.		2	
N/A	E. Grand Terre	BI	1	105	Plaq.	Not provided	East Grande Terre.		2	
N/A	Pass Chaland to Grand Bayou	BI	1	105	Plaq.	Not provided	Pass Chaland to Grande Bayou Pass.		2	
N/A	Pelican Island	BI	1	105	Plaq.	Not provided	Restoration enhancement including elevating dunes and widening islands and planting a mangrove fringe on the backside of the islands across 2.4 miles, approximately 10 feet high and 2000 feet wide.		2	
N/A	Sandy Point Barrier Island	BI	1	105	Plaq.	Not provided	Barrier Island E of Bay Coquette to Sandy Point.		2

A/Z	FD 57	Dredge Bayou Terrebonne from Company Canal to Humble Canal	HR	20	53	Ter.	\$5,000,000 - \$20,000,000	Dredging Bayou Terrebonne will result in an increase in the amount of freshwater available to eastern Terrebonne Parish marshes.	3a
A/Z	FD 58	Dredge Minors Canal (GIWW to Lake Decade)	HR	20	51	Ter.	Not provided	Description not provided.	3a
N/A	FD 62	Dredge Company Canal to Convey Freshwater Flow to Terrebonne Marshes	HR	20	53	Ter.	\$5,000,000 - \$20,000,000	Dredging Company Canal between the GIWW and Bayou Terrebonne will result in an increase in the amount of freshwater available for eastern Terrebonne Parish sustainability.	3a
A/Z	FD 59	Connect St. Louis Canal to Petit Cailloux	HR	20	53	Ter.	Not provided	Description not provided.	3a
N/A	FD 65	Large Pump Station at Bayou Terrebonne	HP	20	53	Ter.	\$500,000	Storm water drainage will be used to introduce freshwater to an area of marsh west of Bayou Terrebonne currently experiencing saltwater intrusion and a high rate of subsidence.	3a
A/Z	FD 66	Pump Station at Bayou Petit Cailloux for Freshwater Diversion to Ward 7	HP	20	53	Ter.	Not provided	Description not provided.	3a
A/Z	FD 79	Bayou Terrebonne Freshwater Diversion Project	FD	20	53	Ter.	\$2,000,000 - \$5,000,000	Through the use of an existing drainage ditch, removal of an earthen plug between the Montegut and Point aux Chenes drainage systems, construction of 3 small pump stations, and construction of a screw gate water control device near the removed plug location, increased volumes of freshwater can be made available to the marshes of Montegut and Point aux Chenes within the Wildlife Management Areas. Over 9,000 acres of brackish and intermediate marsh will be benefitted.	3a
N/A	FD 68	South Lake Decade Freshwater Enhancement and Shoreline Protection	HR, SP	20	51	Ter.	\$5,800,000	Proposed project components include installing three control structures along the rim of the lake and enlarging Lapeyrouse Canal to allow the controlled diversion of Atchafalaya River water, nutrients, and sediments south into project area marshes. Outhaul management structures are planned in the marsh interior to provide better distribution of river water. In addition, approximately 1.6 miles of foreshore rock dyke is planned to protect the critical areas of the south lake shoreline from breaching.	3a
N/A	FD 71	Ashland Freshwater Introduction and Wetland Assimilation Project	WA	20	53	Ter.	\$5,000,000	This freshwater introduction project will incorporate wastewater treatment effluent and freshwater from the GIWW by way of St. Louis Canal to Terrebonne Marshes north of Lake Bourdreaux. Nutrients added to the system will enhance and promote plant growth and the sediment introduced will promote accretion to an area at risk for further deterioration.	3a
N/A	FD 77	Woodlawn Ranch Road	HR	20	53	Ter.	\$500,000	This pump station project is the largest among those considered at 1350 cfs. Utilizing stormwater drainage from the Houma area, freshwater will be introduced to the marshes north of lake Bourdreaux in an area currently impacted by saltwater intrusion and subsidence. This project works in conjunction with Ashland Freshwater Introduction and Wetland Assimilation.	3a
A/Z	FD 85	Reconnect Grand Bayou to GIWW	HR	20	53	Ter.	\$5,000,000 - \$20,000,000	Installation of a water control structure between GIWW and Grand Bayou and dredging of Grand Bayou will be added in order to increase the amount of water available to this region of Terrebonne Parish. Increased sheet flow of freshwater and nutrients will assist in vegetation enhancement and accretion in an area of marsh that is rapidly deteriorating.	3a
A/Z	FD 33	Freshwater Introduction via Blue Hammock Bayou	FD	20	51	Ter.	\$10,000,000	Saltwater intrusion and hydrologic isolation have led to rapid deterioration of marsh within the marshes located adjacent to Faigout Canal, between Bayou Dularge and the Houma Navigation Canal. This project will allow for re-establishment of Atchafalaya River influence.	3a
N/A	FD 80	Freshwater Diversion using the Bayou Terrebonne Flood Gate	FD	20	53	Ter.	Not provided	Description not provided.	3a
N/A	FD 72	Lower Bayou Dularge Pump Station	HR	20	51	Ter.	\$500,000	Pump station D19 will divert approximately 200 cfs of freshwater east of Bayou Dularge into an area of marsh currently experiencing saltwater intrusion and a high rate of subsidence.	3a
A/Z	FD 73	Upper Bayou Dularge	HR	20	51	Ter.	\$500,000	Pump station D18 will be used to introduce approximately 200 cfs of freshwater to the marshes north of Faigout Canal. Marshes in this area are at risk of further deterioration due to saltwater intrusion.	3a
A/Z	FD 74	Mayfield	HR	20	53	Ter.	Not provided	Description not provided.	3a

A/Z	N/A	Franklin Canal Closure and Levee Improvements	HP	21	50	SM.	\$5,775,000	The need for levee improvements in Morgan City was brought to the forefront by FEMA's issuance of new preliminary Digital Flood Insurance Rate Maps (DFIRMs) in 2009, recent levee profile surveys, and a subsequent appeal to FEMA issued by the City of Morgan City. Being proactive in flood protection, the citizens within Consolidated Gravity Drainage District No. 2 (Morgan City and vicinity) passed a bond election in late 2009. Proposed levee and pump station improvements indicate upgrades to existing levees to elevations ranging from 8 feet to 10 feet MSL. The improvements address vulnerability caused by water levels arising from Lake Calcasieu. The proposed upgrades will provide backwater protection from Atchafalaya riverine events and storm surge from the Gulf as well as from stormwater runoff in the Terrebonne Basin north of the city. Upon completion of this project, backwater protection levees in Morgan City will be suitable for certification by the City and FEMA accreditation.	3b
A/Z	N/A	Morgan City Levee Improvements	HP	21	50	SM.	\$16,000,000 - \$20,000,000	Amelia flood protection presently consists of a somewhat disparate, non-certifiable levee system which offers minimal backwater protection from Bayou Doue and Lake Calcasieu. Drainage District No. 6 applied for Statewide Flood Control Program funds to increase the height of the levee to a consistent 7 feet MSL. Partial funding was granted. However, this initial phase is but a fraction of the proposed comprehensive levee system needed for the Amelia vicinity as proposed by the drainage district and state and federal authorities.	3b
A/Z	N/A	Amelia Flood Protection Improvements - Initial Phase (Partial Miller Plan Alternative 2E)	HP	21	50	SM.	\$2,260,350		

PROJECT CONCEPTS FROM COASTAL PARISH MASTER PLANS

Program	Local Project Number	Project Name	Project Type	Project Summary					Planning Unit
				Phase 1 Costs	Phase 2 Costs	Phase 3 Costs	Phase 4 Costs		
A/A	N/A	Hansen Canal and Yellow Bayou - Flood Control Structures	HP	21	50	\$IM.	\$6,200,000	Hansen Canal and Yellow Bayou, both similar to the Franklin Canal were designated to serve as conduits for removal of stormwater following normal rainfall events. However, during hurricanes and related events, both serve as a means for reverse flow generated by storm surge. Hurricanes Rita and Ike are recorded example events. Closures and levee improvements are needed to prevent surge flows from moving inland during surge events.	3b
A/A	N/A	Yokely Levee Improvements	HP	21	50	\$IM.	\$5,000,000	During Hurricane Ike, the Charenton Navigational Canal overflowed its banks and inundated the Yokely drainage area with storm surge. Levee improvements and construction of a berm parallel to Industrial Road and the Charenton Navigational Canal south of US 90 are needed to prevent damages from storm surge inundation.	3b
A/A	N/A	Charenton Canal - Flood Control Structure and Levee Improvements - Alternative 1	HP	21	50	\$IM.	\$114,000,000	This alternative is presented as a flood control structure with embankment improvements along both sides of the Charenton Canal. Embankment improvements are needed to prevent overtopping of the canal along its length near urban areas. These improvements will connect to existing levees that are planned from upgrading and proposed federal and/or State funded levees. The timeframe for the construction of these federal/State levees was indefinite at this writing. Nonetheless, the general consensus is that the local, regional, State, and federal levels is that the major new levee improvements are decades away, dependent upon state and federal funding appropriations. The functional success of this alternative is directly dependent upon completion of proposed federal and state alignments west of the Charenton Canal to and beyond the Cypremont Ridge lying in to highlands of the Teche Ridge near the parish line.	3b
A/A	N/A	Charenton Canal - Flood Control Structure and Levee Improvements - Alternative 2	HP	21	50	\$IM.	\$14,000,000	Alternative 2 proposes the construction of a flood control structure in Bayou Teche east of its intersection with Charenton Canal. This alternative is less costly than the previous option as it is not dependent on future new federal or state levee construction west of the Charenton Canal or along or west of the Cypremont Ridge. A short levee extension extending northward from the westernmost end of the Bayou Yokely Levee reach will be required.	3b
A/A	N/A	Berwick Levee Improvements - Reach W-124 South	HP	21	50	\$IM.	\$200,000	Reach W-124 near Turtle's Corner south of the city limits of Berwick has a height deficient section approximately 75 feet wide and 1.5 feet deep. The proposed project, which is a federal responsibility, is to fill and compact the area to ensure levee height and design consistency with the surrounding system.	3b
A/A	N/A	West of Wax Lake Outlet to Charenton Canal - Continued Levee Improvements	HP	21	50	\$IM.	\$117,000,000	Within the area defined by Drainage District No. 1, this project requires the elevation of 43 miles of levee to no less than 18 feet MSL. The current levee heights range from 3.5 feet to 20 feet MSL, and some reaches of the existing levee system have been breached by storm surge.	3b
A/A	N/A	Amelia Area - Continuation of Miller Plan Alternative 2E	HP	21	50	\$IM.	\$50,000,000	Alternative 2E follows the existing levee alignments in the northwestern section of Amelia and then create an internal levee ring to protect most of the residential areas of Amelia. This alternative excludes much of the industrial area along Bayou Boeuf.	3b
A/A	N/A	Berwick Lock Elevation	HP	21	50	\$IM.	\$1,000,000 - \$100,000,000	The Berwick Lock is currently below the elevation of the surrounding Atchafalaya River levee and seawall and Calumet as a direct function of Atchafalaya River flows, both rivers and surge. The USACE is aware of the lock elevation deficiency and has the responsibility to elevate the height as needed.	3b
A/A	N/A	WHL-O East, Wax Lake East, and W-124 Levee Reach Improvements	HP	21	50	\$IM.	\$22,000,000	The reaches currently protect the municipalities of Bonwick and Patterson and the community of Bayou Vista from storm surge. Currently, the levee reaches range from 9-19 feet MSL. The proposed project would elevate the levees to a consistent 18 feet MSL.	3b
A/A	N/A	SMD Backwater Plan Reconnaissance and Feasibility Analysis	HP	21	50	\$IM.	\$100,000	Reconnaissance Study and possible feasibility analysis	3b
A/A	N/A	Amelia Area - Miller Plan Alternative 3E	HP	21	50	\$IM.	\$171,650,000	This alternative is presented in the Miller Plan, begins in Assumption Parish on the east side of Bayou Boeuf near its intersection with Lake Palourde, continues southward east and inclusive of existing urban areas, crosses the Intracoastal Waterway with a control structure, continues westward in St. Mary Parish south of the Intracoastal Waterway along the higher ground of Avoca Island in a generally northwest direction, and ties into the Avoca Levee near the Bayou Boeuf Locks south of Morgan City.	3b
A/A	N/A	Amelia Area - Louisiana State Master Plan Alignment 1E	HP	21	50	\$IM.	\$400,000,000	The Louisiana State Master Plan Alignment begins east of St. Mary Parish coming westward from Terrebonne Parish to the east bank of Bayou Boeuf, crosses Bayou Boeuf south of the railroad track via a control structure, follows Bayou Boeuf on the Amelia side southward then turns northwest along the bank, proposes a lock in Bayou Boeuf connection to Avoca Island levee near the Bayou Boeuf locks at Morgan City.	3b
A/A	N/A	Amelia Area - SMD Backwater Prevention Plan 4E	HP	21	50	\$IM.		An additional alternative was presented during the planning process (4E) involving the construction of a backwater protection flood control structure in Bayou Chene south of the GIWW with associated new levee alignments. This alternative is in the conceptual stage of planning and requires additional analysis, comparison, and contrast to the other eastern St. Mary and regional backwater protection alternatives. Once reasonable feasibility is established, a detailed evaluation of this alternative may be warranted as a suitable alternative in the state master plan. An initial investigation generally following the guidelines of a USACE reconnaissance study would be in order in an effort to determine the basic feasibility of the alternative. A more detailed feasibility will follow should the project prove feasible with benefits and cost comparable to Alternatives 1E and 3E.	3b

PROJECT CONCEPTS FROM COASTAL PARISH MASTER PLANS

Program	Local Project Number	Project Name	Project Type	House District	Project Cost*	Project Summary		Planning Unit
						Levee	Flood Control	
N/A	N/A	Bayou Choupique Levee Improvements and Flood Control Structure	HP	21	50	\$IM.	\$40,000,000	Bayou Choupique functions as a conduit for storm surge much like the canals noted previously. A flood control structure and associated levee improvements are proposed to ensure adequate flood protection for the west end of the parish.
N/A	N/A	Bayou Sale - Levee Improvements	HP	21	50	\$IM.	\$32,700,000	The levees along Bayou Sale are proposed for elevation to 18 feet MSL to ensure adequate storm surge protection. Gordy and Eilerelle reaches are included.
N/A	N/A	West of Charleton Drainage Canal - Levee Construction - Miller Plan (SMLD Alternative 2W)	HP	21	50	\$IM.	\$66,250,000	This Miller Plan alternative proposes a levee alignment west of the Charleton Canal that generally follows the 5 foot contour extending westward along the east side of the Cypermont Ridge, crosses Bayou Cypermont with a minor control structure, then generally follows the 5 foot contour along the west side of the ridge to appropriate connecting elevations of the Tech Ridge.
N/A	N/A	West of Charleton Drainage Canal - Levee Construction - Louisiana State Master Plan (SMLD Alternative 1W)	HP	21	50	\$IM.	\$35,000,000	The Louisiana State Master Plan proposes a levee alignment which generally follows the alignment of the Miller Plan's western levee routing, but instead of turning south at the Cypermont Ridge, it continues westward crossing the ridge and extends to and beyond the parish line into Iberia Parish.
N/A	N/A	Scott Canal - Flood Control Structure	HP	21	50	\$IM.	\$500,000	Scott Canal acts as a conduit for storm surge much like the Franklin Canal. A flood control structure is proposed to ensure adequate flood protection for the west end of the parish.
N/A	N/A	Kelley Canal - Flood Control Structure	HP	21	50	\$IM.	\$500,000	Kelley Canal acts as a conduit for storm surge similar to others noted. A flood control structure is proposed to ensure adequate flood protection for the west end of the parish.
N/A	N/A	Vacherie Canal - Flood Control Structure	HP	21	50	\$IM.	\$500,000	The Vacherie Canal acts as a conduit for storm surge similar to others noted. A flood control structure is proposed to ensure adequate flood protection for the west end of the parish.
N/A	N/A	Bayou Tigue Watershed/Flood Protection	HP	28	49	Ver.	Not provided	Provide protection to the watershed from storm events by construction of a levee system and water control structures that would link to similar measures in Iberia Parish.
N/A	N/A	Flood Control Structure at Boston Canal	HP	26	50	Ver.	Not provided	Construct a flood control structure at the intersection of Boston Canal and the GIWW that could be closed in the event of a hurricane or tropical storm that would aid in stemming the rise of flood waters.
N/A	N/A	Four Mile Canal Structure	HP	28	47	Ver.	Not provided	A reduction in the cross-sectional area of the channel by installing a structure at the terminal end which could be closed during storm events. An opening in the structure would allow the passage of marine vessels and barges. This would be in conjunction with other measures proposed for the GIWW whereby spoil elevation and armoring along the south side of the GIWW is proposed.
N/A	N/A	Hebert Canal Watershed/Storm Protection	HP	26	47	Ver.	\$3,000,000	Install control structure on the Hebert Canal at the marsh/upland interface and raise the level of existing protection levees that will afford increased protection to communities from saltwater intrusion damage and flooding from storm surges. A previous plan created by the USDA NRCS has been completed and has engineering and design data.
N/A	N/A	Protection Levee on the Marsh/Upland Interface	HP	28	47/50	Ver.	Not provided	By raising the height of an existing system of agricultural levees, an additional line of defense from tidal surges could be recognized. These existing levees would serve as a sound base for increasing the elevation.
N/A	N/A	LA Hwy. 330 Hurricane Protection	HP	26	50	Ver.	Not provided	Armor the south side of the east/west side of LA 330.
N/A	N/A	Flood Control Structure at Oaks Canal	HP	26	50	Ver.	Not provided	Construct a flood control structure at the intersection of Oaks Canal and the GIWW that could be closed in the event of a hurricane or tropical storm that would aid in stemming the rise of flood waters and protect surrounding wetlands.
N/A	N/A	Freshwater Bayou Bank Stabilization	SP	26	47	Ver.	Not provided	Provide protection to the eastern spoil banks along Freshwater Bayou by repairing existing breaches and subsequently armoring the existing spoil bank. This would create a sound boundary which would protect surrounding fragile wetlands and also provide protection from storm surges during a tropical storm or hurricane. Measures also would be undertaken to reduce the cross-sectional area of the intersection where Bayou Chene intersects Vermilion Bay.
N/A	N/A	Utilization of Existing Oil Field Canals	HP	26	47/50	Ver.	Not provided	Using existing oilfield canal spoil banks, raise existing elevation so that it would serve as a buffer that would intercept and minimize storm surge impacts and help reduce the amount of water borne floatsam and debris.

Project Type: BI=Barrier Island; DM=Beneficial Use of Dredged Material; FD=Freshwater Diversion; HP=Hurricane Protection; HR=Hydrologic Restoration; INF=Infrastructure; LA=Land Acquisition; MC=Marsh Creation; MN=Marsh Management; OM=Outfall Management; PA=Public Access; PI=Planning; PR=River Restoration; SD=Sediment Division; SNT=Sediment and Nutrient Trapping; SP=Shoreline Protection; VP=Vegetation Planting; WA=Wastewater Assimilation.

RESTORATION PARTNERSHIP PROJECTS

Program	Project Number	Project Name	Project Type	Project Sponsor	Project Co-Sponsor	Planning Unit	Project Summary	
							Rest. Partnerships	Rest. Partnerships
Rest. Partnerships	N/A	Westwego WHARF	LA	City of Westwego	Jef.	\$1,000,000 (State) \$1,250,000 (TPL Match)	In 2008, the Trust for Public Land (TPL) helped the City of Westwego acquire a 92-acre tract of cypress/bottomland hardwood forest that will provide the residents of Westwego water access to the Jean Lafitte Historical Park, Bayou Segnette State Park, and Lake Salvador Game Management Preserve. This property will be developed into a wetlands park known as the WHARF – Wetlands Harbor Activities Recreational Facility. This facility will provide opportunities for the physically challenged to experience Louisiana's natural environment. The Partnership Fund will provide \$1 million to the City of Westwego for repayment to TPL to help them recoup some of the costs of the acquisition.	2
Rest. Partnerships	N/A	Terrebonne Vegetative Plantings	VP	Terrebonne Parish Consolidated Government	Ter.	\$40,000 (State) \$30,000 (TPCG Match)	Terrebonne Parish, in partnership with the Barataria Terrebonne National Estuary Program (BTNEP) will conduct a series of four vegetative plantings on the newly created marsh cells at site of the recently completed CWPPRA Project TE-44, North Lake Merchant Landbridge. Earthen plugs will also be planted. Terrebonne Parish will provide additional financial support, and the BTNEP will provide project implementation services, including logistical support and volunteer coordination. Terrebonne Parish and BTNEP also propose to conduct vegetative plantings at three additional sites: the marsh area adjacent to the Upper Petite Caillou (Bayou Neuf) pump Station near Chauvin, the toe of the non-federal levee near Dulac (Suzy Canal), and in the Caillou Marshes EMU on and adjacent to the Harry Bourg Corporation property.	3a
Rest. Partnerships	N/A	North Lake Merchant Landbridge Completion	MC	ConocoPhillips	Ter.	\$30,000 (State) \$5,000 (ConocoPhillips Match)	The project consists of dredging approximately 875 cubic yards of sediment to construct an earthen plug. The proposed earthen plug is needed to complete the CWPPRA Project TE-44, North Merchant Landbridge Restoration. The plug will be planted with natural vegetation for this area.	3a
Rest. Partnerships	N/A	Christian Marsh Terraces Project	SNT, VP	Coalition to Restore Coastal Louisiana	Ver.	\$454,720 (State) \$298,000 (CRCL Match)	The project proposes to build terraces and plant vegetation within an area of shallow open water that was formerly vegetated marsh. The project will create 20,850 linear feet of terraces which will enhance and protect an additional 300 acres of adjacent marsh. To protect the shoreline of the new terraces and to help bind the newly placed soils, appropriate vegetation will be planted by volunteers recruited from the local communities and across South Louisiana.	3b
Rest. Partnerships	N/A	Catacasieu-Sabine Watershed Restoration	HR, SNT	Ducks Unlimited	Cal.	\$1,780,805 (State) \$966,214 (DU Match)	The objectives of this project are to 1) restore the historic flow of First Bayou, thereby providing fresh water to the surrounding marshes and preventing flooding to communities in the area; 2) create marsh terraces in the Gum Gove region to reduce wave fetch, prevent erosion, and promote the growth of emergent/submerged vegetation; and 3) restore the cross-sectional elevations of Oyster Bayou to help promote healthy marsh in the area. The proposed restoration would reroute drainage through First Bayou and associated roadside conveyances, under the First Bayou-Highway 27 Bridge and into Mud Lake. A total of 105,000 linear feet of marsh terraces are proposed to benefit approximately 1,200 acres of marsh and help restore habitats for commercial and recreational activities throughout the Catacasieu-Sabine region. Restoration of Oyster Bayou's cross-sectional elevations will return salinity patterns and variations to a semblance of their historical patterns, and thereby return ultimately result in marsh recovery and the creation of land.	4
Rest. Partnerships	N/A	10,000 Trees for Louisiana	VP	Coalition to Restore Coastal Louisiana	Jef., Plaq., SNT., Tan., Ver.	\$84,475 (State) \$335,790 (CRCL Match)	The Restoration Tree Trust has donated a total of 10,000 native trees for vegetative planting in the Coalition to Restore Coastal Louisiana's (CRC) Community-Based Restoration Program. Over 25 species of trees are available and will be planted in densities ranging from 125 to 150 trees per acre. Tree protectors will be purchased to reduce predation. Multiple project sites have been identified across the coast from Southwest Louisiana to the Mississippi Delta.	Coastwide
